Safety Instructions

1. Read these instructions.
2. Keep these instructions.
3. Heed all warnings.
4. Follow all instructions.
5. Do not use this product near water.
6. Clean only with a dry cloth.
7. Do not block any ventilation openings. Install in accordance with the manufacturer’s instructions.
8. Do not install or place this product near any heat sources such as radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat.
9. Do not defeat the safety purpose of a polarized or grounding-type plug. A polarized plug has two blades with one wider than the other. A grounding type plug has two blades and a third grounding prong. The wide blade or the third prong are provided for your safety. If the provided plug does not fit into your outlet, consult an electrician for replacement of the obsolete outlet.
10. Protect the power cord from being walked on or pinched particularly at plugs, convenience receptacles, and the point where they exit from the apparatus.
11. Only use attachments/accessories specified by the manufacturer.
12. To reduce the risk of electric shock and/or damage to this product, never handle or touch this unit or power cord if your hands are wet or damp. Do not expose this product to rain or moisture.
13. Unplug this apparatus during lightning storms or when unused for long periods of time.
14. Refer all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as power-supply cord or plug is damaged, liquid has been spilled or objects have fallen into the apparatus, the apparatus has been exposed to rain or moisture, does not operate normally, or has been dropped.
15. Batteries that may be included with this product and/or accessories should never be exposed to open flame or excessive heat. Always dispose of used batteries according to the instructions.
The ZyPer Management Platform includes the ZMP web interface. The following browsers are supported:

► Google Chrome version 55.0.2883 or greater

► Mobile Devices: Android tablet 7.0, MS Surface Windows 10, iPad iOS 10.3.2 and higher

Refer to the Support page on the ZeeVee web site to download the latest firmware.

Features and Package Contents

Features

• Pre-configured Linux O/S is maintenance-free and includes upgrades and support.

• Plug & Play operation will discover and enable labeling and control of any number of ZyPer4K, ZyPerUHD or ZyPerHD encoders and decoders.

• Interface allows the independent routing of video, audio and control signals.

• The feature-rich API makes ZyPer4K / ZyPerUHD / ZyPerHD the perfect add-on to existing distribution systems without the time and dollars usually required for custom programming.

• Presets enable signal routing and scheduling of saved, pre-defined source-display settings for easy duplication and recall.

• Real time system monitoring includes generating alerts for offline or disconnected ZyPer4K / ZyPerUHD / ZyPerHD devices, sources and displays.

• Auto detection/discovery of additional encoders and decoders make system scaling a snap.

• Easily create and manage video walls of any pattern or configurations up to a 15x15 array.

• Create and manage Multi-view displays with up to 19 sources. (ZyPer4K only)
New Features

- Presets and Scheduling
- Updated Device Grid
  - Independent Source and Display Grids
  - Ability to save Source and Display grid information to .CSV file
  - Ability to import updated .CSV file to Management Platform
  - Ability to route video and audio from the Grid
  - Ability to upload custom source/display icons
  - Advanced EDID management from within the ZMP GUI.
  - Ability to customize decoder output parameters manually from the ZMP GUI. (Bypass EDID)
- Multiview now supports up to 19 windows (ZyPer4K only)
- Video Wall support up to 225 screens. (15x15) (ZyPer4K only)
- Support for Isaac system from Smart Monkeys
New in Release 2.2

Command Syntax Change “CamelCase” Commands

Commands released prior to 2.2 are mostly hyphenated. A major change in 2.2 is to “default” all command tokens to camelCase. However, all commands changed to camelCase are 100% backwardly compatible:

• API Help will show only camelCase command syntax
• API autocompletion will only complete to camelCase syntax
• But: API input will still accept the hyphenated commands as defined in 2.1

For example, the following versions of the same command are accepted in 2.2

set decoder decl display-size auto
set decoder decl displaySize auto
New in Release 2.2

New HELP Command Features

To make it easier to find commands, help now supports groups.

• help – lists all groups

• help <group> -- lists commands within a group.

     Note: The same command may appear in more than one group.

• help all byGroup – lists all groups and all commands in each group

• help all alphabetical – the same as in 2.1
New in Release 2.2

New/Updated Commands (See API Command Listing)

- add device
- add snmp
- create presetNew
- create presetSchedule
- dataConnect
- delete
- delete snmp
- delete preset
- diagnostics device
- events (Added IrDongleButtons event)
- factoryDefaults
- flashLEDs
- help
- join
- load encoderEdid
- logging
- previewStream
- redundancy
- restart device
- run preset
- save deviceEdid
- save system config
- send
- set decoder
- set device
New in Release 2.2

New/Updated Commands  (See API Command Listing)

• set encoder
• set multiview
• set preset
• set server
• set server date
• set videoWall size
• show dataTunnels  (Previously show data-relays)
• show device
• show multiviews
• show preset
• show previewStreams
• show snmp
• show values
• show videoWalls
• troubleReport
• update device
New in Release 2.2

Deleted/Removed Commands  (See API Command Listing)

- show data-relays  (Now show dataTunnels)
- restart server

</table>

---

![Power Button](image1)

![Status LEDs](image2)

Ethernet Port 0 = Video Port. DHCP default IP Address
Ethernet Port 1 = Management Port.
Static IP Address: 192.168.20.2  Subnet Mask: 255.255.255.0
Installation

1. Connect the included power supply to the power receptacle on the ZyPer Management Platform.

2. Connect the included AC power cord from the power supply to an available electrical outlet.

3. Connect an Ethernet cable from the ZyPer Management Platform to a switch that is on the same LAN that will be hosting the ZyPer devices. Although the ZyPer Management Platform can be connected anywhere on the LAN, it is recommended that it is connected to the primary switch where the ZyPer endpoints are connected.

   **NOTE:** If the ZyPer Management Platform does not detect a DHCP server within 60 seconds, a link-local address of 169.254.xxx.xxx will be assigned to the ZyPer Management Platform. If you wish to use static or fixed-mapping using DHCP, then see Network Configuration (page 10).

Using Windows®

a. Connect an Ethernet cable from your computer to the same switch as above.

b. Go to the **Network** folder.

c. Locate the icon titled “ZyPer Management Server” followed by an IP address. This is the IP address of the ZyPer Management Platform.

Using OS X®

a. Connect an Ethernet cable from your computer to the same switch as above.

b. Open the Terminal application.

c. **At the prompt,** enter `ping zyper.local`.

d. The IP address of the ZyPer Management Platform will be displayed.
4. Open a web browser and enter the IP address of the ZyPer Management Platform.

5. The login screen for the ZMP will be displayed.

6. Enter **admin** for both the **Username** and **Password** fields. See Management Platform Login (page 9) for more information.

7. Click the **Login** button.

---

**Sample Application Diagram**
Management Platform Login

1. Directly connect an HDMI cable between the Management Platform and a Display. (Note that a USB keyboard is also required to be connect to the Management Platform)

2. After boot the login prompt will appear. At the login prompt, enter the following login name: zyper

   After entering the login name, the password prompt will be displayed.

   zyper login: zyper
   Password:

3. Enter the password. The default password is zyper. Note that the password will not be echoed to the screen. Once the password is entered, the screen will appear similar to the following:

   zyper login: zyper
   Password:

4. Use the show server info command to find the IP Address of the Managment Platform

   show server info
   server(172.16.6.111);
   server.gen; hostname=zyper.local, version=2.2.36738, previousVersion=2.2.36735, macAddress=94:c6:91:a2:7a:fc, serialNumber=ZZM1K400007D
   server.gen; uptime=3d:18h:37m:33s, freeMem= 6.76GB, bootCount=55
   server.gen; runningInVm=false
   server.ip-active; ipServerAddr=172.16.6.111, ipManagementAddr=NA, gatewayAddr=172.16.6.1, dnsAddr=172.16.2.2
   server.time; time="Mon Mar 29 11:32:43 2021", timezone=America/New_York
   server.license; productID=354CAA85-E826-41BC-6878-94C691A27AFC, license=none
   server.license; limit=24, knownDevices=18, devicesUp=13, devices Exceeded=0
   server.deviceUpdates; active=0
   server.activeDeviceVersions; num_0.0.0.0=3, num_2.11.3.0=1, num_2.11.4.0=1, num_4.1.0.0=8
   Success
Network Configuration

The default configuration of the Management Platform will use DHCP with link-local addressing support. Link-local addressing allows the Management Platform to have an IP address on a network, even if the Management Platform has not been manually configured or automatically configured by a DHCP server. If a DHCP server is not detected within 60 seconds, a link-local address of 169.254.xxx.xxx will be assigned to the Management Platform.

If you wish to use a static IP address, this can be done in one of two ways: Add a fixed mapping to the DHCP server or by directly assigning a static address to the Management Platform. Both methods are covered in this section.

Fixed Mapping using DHCP

Before continuing, make sure that the static IP address being used does not conflict with any DHCP-assigned addresses. Contact your system administrator for assistance.

1. At the login prompt, enter the following login name: zyper
   
   After entering the login name, the password prompt will be displayed.
   
   zyper login: zyper
   Password:

   Enter the password. The default password is zyper. Note that the password will not be echoed to the screen. Once the password is entered, the screen will appear similar to the following:

   Zyper$

   Use the show server info command to find the Mac Address of the Management Platform
show server info

server(172.16.6.111);

   server.gen; hostname=zyper.local, version=2.2.36738, previousVersion=2.2.36735, macAddress=94:c6:91:a2:7a:fc, serialNumber=ZZM1K400007D

   server.gen; uptime=3d:18h:37m:33s, freeMem= 6.76GB, bootCount=55

   server.gen; runningInVm=false

   server.ip-active; ipServerAddr=172.16.6.111, ipManagementAddr=NA, gatewayAddr=172.16.6.1, dnsAddr=172.16.2.2

   server.time; time="Mon Mar 29 11:32:43 2021", timezone=America/New_York

   server.license; productID=354CAA85-E826-41BC-6878-94C691A27AFC, license=none

   server.license; limit=24, knownDevices=18, devicesUp=13, devices-Exceeded=0

   server.deviceUpdates; active=0

   server.activeDeviceVersions; num_0.0.0.0=3, num_2.11.3.0=1, num_2.11.4.0=1, num_4.1.0.0=8

Success

After programming the DHCP server to assign a specific address to the Management Platform, reboot the Management Platform, using the following command, to use the new IP address.

restart server

Success

Static IP Configuration

Before continuing, make sure that the static IP address being used does not conflict with any DHCP-assigned addresses. Contact your system administrator for assistance.

Using the set server ip command can be used to set the IP Address of the Management Platform. Refer to API Command Listing (page 84) for a full listing of available commands.

set server ip server static 192.168.1.26 255.255.255.0 none reboot

Success
2 Basic Operation
Accessing ZyPer Management Platform

1. Open a web browser and enter the IP address of the Management Platform.

2. The login screen for ZMP will be displayed.

3. Enter the required information in the **Username** and **Password** fields. The default username and password is **admin**. The username and password are case-sensitive. The “admin” password may be changed by the user at any time.

4. Click the **Sign In** button.

5. The **Home** page will be displayed. See the next section for more information.
Home Page

The Home page of the ZyPer Management Platform displays all available Sources, Displays, Walls, Zones, Multiviews, Server Info, Users, Roles, Logs and Help.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. The Home page will be displayed. The Sources pane displays all available encoders. The Displays pane displays available decoders. Walls, Multiview, Zones, Presets, Source Grid, Display Grid, Server, Users and Roles will be covered in upcoming sections.
Device Status Indicators

Each Source and Display contains a status indicator border color, displaying current information about the device. This is particularly useful for devices that may be in a separate part of a building or several miles away.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Indicator Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK</td>
<td>Green</td>
</tr>
</tbody>
</table>

1. Indicates that an HDMI cable is connected between the encoder and the source or between the decoder and a display or other sink device. Decoder is receiving a valid video stream.

2. The encoder / decoder is powered.

3. The Ethernet cable is connected between the switch and the encoder / decoder.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Indicator Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warning</td>
<td>Yellow</td>
</tr>
</tbody>
</table>

1. HDMI cable may not be connected between the encoder and the source or between the decoder and a display or other sink device. Decoder may not be receiving a valid video stream.

Note that this indicator may also indicate a faulty HDMI cable.

2. The encoder / decoder is powered.

3. The Ethernet cable is connected between the switch and the encoder / decoder.
<table>
<thead>
<tr>
<th>Meaning</th>
<th>Indicator Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Red</td>
</tr>
</tbody>
</table>

1. The Ethernet cable is *disconnected* between the switch and the encoder / decoder.

2. The encoder / decoder may not be powered.
Basic Operation

Displaying Devices By Status

Both the Sources and Displays window contain a Filter by status option. There are check boxes to filter by Status (Green, Yellow, Red), Device Type (4K, UHD or HD), USB (Present, Not present) There is also an option to filter Sources or Displays by name.

1. Click the Filter Icon.

2. Only those devices with the selected status will be displayed. As illustrated in this example, only ZyPer4K devices are shown in the Sources window. ZyPerHD and ZyPerUHD sources are filtered out.

3. Select every box from the Filter to show all devices.
Displaying Devices By Name

Both the **Sources** and **Displays** windows contain a **Filter by name** field. Use this field to enter the name of the desired device(s) to be displayed. As text is entered, the interface automatically begins a search of the current string for each recognized device. Devices that are displayed must contain the text (in sequence) that is currently in the **Filter by name** field. Text searches are case-sensitive.

1. Click in the **Filter by name** field.

   ![Filter by name field](image)

   This example uses the following named sources. For more information on naming sources see Configuring Encoders and Decoders (page 23).

2. Type the desired sequence of characters in the **Filter by name** field to search. In this example, we want to only display the “Wildlife” source devices. To do this, we can enter part of the name, such as “Wild” or even “W” (since no other device name contains the character “W”). All text entries are case-sensitive.

![Filter by name field](image)
Manually Setting Sort Order

Both the Sources and Displays windows can be sorted manually. Every device is assigned a “sort order” number. The user can change this sort order number manually.

1. Click on the device identifier. (Little “4K” or “UHD” or “HD” in upper left corner of device.) Note: Must be configured for Join Mode rather than Preview Mode. See the section on Video Preview mode on the following pages.

   ![Sort Order Example](image)

   This will bring up a Sort Order option for the selected device. The example below the device is assigned to Sort Order position 1. (Top Left of the Source window) This number can be changed to any number desired up to the number of sources.

2. Sort Order numbering runs from top left to bottom right. In the image above assuming only 5 sources, the top three would be location 1, 2 and 3; while the bottom two would be locations 4 and 5.
Joining Encoders to Decoders

“Joining” is the process of assigning an encoder (source) to a decoder (display) or a video wall. Before starting the join process, we recommend that you configure the encoder and decoder settings. Refer to Configuring Encoders and Decoders (page 23).

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.
2. Drag and drop the desired source on to the desired display.

3. The display icon will change to show that it has now been joined with a source. (Small chain link icon) Hover over the chain link for additional status info. Also the icon will change to match the source and name of the source will appear at the top of the icon.

4. Continue the join process as desired. Note that joining an encoder with a decoder that is already joined, will replace the previous join operation.

The join command can also be used to perform the same operation. See API Command Listing (page 85) for more information.
Unlinking Encoders and Decoders

As mentioned earlier, joining an encoder with a decoder that is already joined, will replace the previous join operation. However, there may be situations where you want to completely remove any source from being shown on a display. To do this, use the Disconnect AV feature or Disconnect Joins.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. On the Sources window, right-click on any Source. Select Configure Join and then Disconnect AV.

3. Drag that source onto the Display that you would like to unlink.

4. Alternately you can right click on the “Chain Link” icon and select “Disconnect Joins”

5. The display icon will change to show that it has been unlinked and no longer joined with any encoder. (Yellow perimeter, small chain link icon is gone, icon returns to default and name of joined source is gone)
Basic Operation

Video Preview Stream

It is possible to view a small thumbnail preview of the active stream in the GUI within either the encoder or decoder box. Once preview streams are enabled, you can see them by following the steps below: (Supported on ZyPer4K and ZyPerUHD only)

**Note:** It will take several seconds for the preview stream to appear once activated. There is a maximum of 20 preview streams available at any given time.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. On the **Sources** window, click on the small “4K” or “UHD” located in the upper left corner of the window. This will toggle the GUI between showing an icon and showing the preview stream. **Note:** Video Preview Mode but be set at shown in step 3 below.

3. Click on the gear icon in the top right corner of the ZMP to enable or disable the “Big Preview” option. When enabled, hovering the cursor over a preview stream will make the preview approximately 50% larger while you keep the cursor over the stream.

4. Note that preview stream can be viewed for both **Sources** and joined **Displays**. All other functionality remains the same. The preview stream updates about 1 time per second. (Multiviews are not available as preview streams. Clicking on preview at the decoder for a multiview will give the appearance that the multiview has failed.)

5. **Important Notes:** The PC/Laptop attempting to view preview streams **MUST** have access to the Internet to download a player in the background. **ZyPer4K MUST** be on firmware version 4.0.1 or newer.
Source/Display Config Page

Configuring Encoders and Decoders

When an encoder or decoder is connected to the network, the Management Platform identifies each unit by its MAC address. This is the default setting. However, when dealing with several units, it is much easier to identify a unit by a string name. It is also possible to assign a preset image to each icon, set the network mode, RS232 settings, and more.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the Source or Displays tab at the left of the page. Joining Encoders to Decoders (page 20)

3. All available encoders will be displayed under the Sources window.
4. Left-click the desired encoder name to display the context menu. In the example below, we will select the encoder named “Cuba”.

5. A menu will appear with options for Summary, ID, Status, Config and Actions.

6. Selecting the ID option will allow you to manually give the Source a name.

7. Enter a description for the source in the **Name** field. By default, the Management Platform will use the MAC address of the encoder. This field cannot be blank. Names cannot contain spaces. In this example, we will use “ESPN1”.

   Naming a device can also be done using the `set device general name` command. See [API Command Listing (page 85)] for more information.
Each encoder and decoder must have a unique name. Duplicate names are prohibited. It should be noted that assigning a name to an encoder does not actually replace the MAC address. The Name field provides a descriptive identifier, rather than a MAC address.

8. Click the **Config-Icon** drop-down list to select the desired icon for this source. This is optional. If no icon is selected, then the default icon will be used. In this example, we will select **ABC**, since a ABC is connected to this encoder.

The `set device source-display iconImageName` command can also be used to assign an icon to a device. See **API Command Listing (page 85)** for more information.

9. Enter the **Manufacturer**, **Model**, and **Serial Number** of the source or display in the appropriate fields. By default, these fields are set to “none”. These fields must not be blank. If a custom value is provided, it must not contain spaces.
The Manufacturer, Model, and Serial Number can also be assigned using the following commands, respectively. See API Command Listing (page 84) for more information.

► set device source-display manufacturer
► set device source-display model
► set device source-display serialNumber

10. Enter the location of the source or display device in the Location field. By default, this field is set to “Unknown”. This field must not be blank. If a custom value is provided, it must not contain spaces.

11. The set device source-display location command can also be used to set these values. See API Command Listing (page 85) for more information for more information.

12. Use the Config-IP Mode section to configure the IP setting for the encoder. By default, both encoders and decoders are set to DHCP mode and will be discovered automatically by the Management Platform. To manually configure the IP settings of the encoder, click the Mode drop-down list and select static. Once in static mode, the information in the Address, Mask, and Gateway fields can be edited.
13. Use the **Baudrate** section of **Config** to configure the RS232 settings for the control device, such as an automation control system. Click the **Baudrate** drop-down list to select the desired baud rate of the control device.

The **Device IP** settings can also be assigned using the `set device ip dhcp` and `set device ip static` commands. When assigning **RS232** settings from the command line, use the `set device rs232` command. See **API Command Listing** (page 85) for more information.

14. By default, ZyPer4K and ZyPerUHD Encoder audio format parameters will inherit the Server Default configuration.

**Only PCM** - Ignore the Server Default setting and restrict the EDID to PCM audio only

**Allow Compressed** - Ignore the Server Default setting and allow Compressed audio on the encoder.

**NOTES:** For this setting to work properly, the source’s audio configuration should be set to automatically determine audio, if possible. If the source is not able to automatically determine audio, it needs to be manually set to the desired auto format. Downmixing hdmi audio (sending audio out of the analog port) can only be done if the hdmi stream is PCM – not compressed.
Encoder and Decoder Status Information

You can obtain status information about an *encoder* and its source at any time, from the *Source Config* page.

1. Login to the ZMP. Refer to *Accessing ZMP (page 13)* for more information.

2. Left-click the desired source name and select the *Status* option from the context menu.

<table>

</table>
Deleting, Rebooting or Resetting an Encode or Decoder

If an encoder or decoder is disconnected from the network, the Management Platform will continue to display the encoder or decoder within the ZMP until it is removed. Note that; reconnecting the encoder or decoder will cause it to once again be displayed in the ZMP.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the Sources tab at the left of the page.

   ▶ To delete an encoder or decoder:

   a. Left-click on the desired encoder or decoder name and select Actions from the context menu.
b. Click the **Delete** button.

3. The following prompt will be displayed when deleting a *source*.

   **Are you sure?**

   Would you like to delete device Cuba?

   [Cancel]  [Delete]

4. Click the **Delete** button to confirm the operation. Click the **Cancel** button to cancel the operation.

5. This same menu can be used to Reboot the device or set the device back to Factory Defaults by clicking the appropriate button.
Sending a CEC Command

Both the ZyPer4K and ZyPerUHD can send CEC on/off commands from within ZMP. The ZyPer4K can send additional CEC hex commands as well.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the Source tab at the left of the page.

   ▶ To send a CEC command:

   a. Left-click on the desired encoder or decoder name and select Actions from the context menu.
b. Click the desired **CEC On** or **OFF** button. (ZyPer4K or ZyPerUHD)

3. The ZyPer4K can also send Hex commands over CEC. Just type the Hex command into the box. When completed, click anywhere outside of the Hex input box to send the command.
Basic Operation

Sending an RS232 String Command

Both the ZyPer4K, ZyPerUHD and ZyPerHD can be sent RS232 strings from the ZMP to be output on the RS232 port of the unit.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the **Source** tab at the left of the page.

   ▶ To send an RS232 string command:

   a. Left-click on the desired encoder or decoder name and select **Actions** from the context menu.
b. Scroll down to the RS232 box and enter desired text. Click anywhere outside the box to send the text string command.
Updating Firmware

If there is a firmware update available for the ZyPer4K, ZyPerUHD or ZyPerHD, the update can be performed easily from within ZMP.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the Source tab at the left of the page.

   To delete an encoder or decoder:

   a. Left-click on the desired encoder or decoder name and select Actions from the context menu.
b. Drag and drop the appropriate firmware update file into the box and click on the “Update Device” button.

3. You will be prompted to confirm this the desired action. Confirm the action by clicking the Update button. The ZyPer unit will automatically reboot itself once the firmware update is complete.

Are you sure?

Would you like to update the device NBC with Z4K_Firmware_HDMI2.0_v4_0_1_0.apz?
Creating Video Walls

One of the purposes of the Management Platform is to create and manage video walls. A video wall is a collection of displays or projectors arranged in a square or rectangular fashion. The source is then “mapped” to each display, thereby creating one large display from multiple, smaller displays.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the Walls tab at the left of the page.

3. In the Walls pane, click on the + button to create a new video wall.
4. This will bring up the wall **Editor**.

5. Enter the number of display columns in the **Number of Columns** field.

6. Enter the number of display rows in the **Number of Rows** field.

   In this example, we have arranged our displays in two rows and two columns. This is a blank 2x2 **video wall**:
7. Drag Displays from the Display pane into the Editor to populate the wall. Provide a name for the new video wall in the Name field. Values in this field cannot contain spaces. Since more than one video wall can be created, always be sure to provide a descriptive name. This field cannot be blank.

8. Leave the Bezel Top, Bezel Bottom, Bezel Left, and Bezel Right set to 0. Bezel compensation will be covered in the next section.

9. Click the Create button.

10. The new Wall will now be available within the Walls window.

11. Video Walls are deleted by clicking on the small Trash Can icon. The user will be prompted to confirm deletion.

Are you sure?

Would you like to remove "wall1" video wall?

Cancel  Remove
Bezel Compensation

Every video output device has an area where video is not displayed. This area is called the **bezel**. **Bezel compensation** takes this area into account when a single video source is divided and displayed on multiple output devices.

1. Check the output on the video wall and identify any misaligned edges. For best results, it is recommended to use a static video pattern for this test.

   In the illustration on the left, we have a 2x2 video wall without **bezel compensation**. Note the ZeeVee logo is not aligned correctly across all four displays. On the right, **bezel compensation** is used to fix the issue.

   ![Without Bezel Compensation](image)

   ![With Bezel Compensation](image)

   Without Bezel Compensation

   With Bezel Compensation

   It is recommended that when the video wall is set up for the first time, that these values be set to zero. **Bezel compensation** can be changed at any time.

   **Bezel compensation is always measured in pixels.**

2. Left click the edit video wall button in the lower left corner of the desired wall.

   ![Walls (1)](image)
3. The video wall editor will come back up onto the screen.

4. Enter the desired values, in pixels, for each bezel field: Bezel Top, Bezel Bottom, Bezel Left, Bezel Right.

5. Once the desired values have been entered, click the Update button. This will save the new settings.

6. Check the picture on the displays. Repeat steps 2 - 5 as necessary.

7. Note: Only the ZyPer4K allows bezel adjustment. Video walls with the ZyPerHD or ZyPerUHD do not allow bezel adjustment.
Creating a Multiview Screen

One of the purposes of the Management Platform is to create and manage multiview screens. A multiview screen is a collection of sources arranged on a single display. There can be up to 19 sources displayed on a single display in a variety of preset patterns.

**Note:** Only the ZyPer4K versions with the HDMI 2.0 feature support multiview screens. This feature is not supported by the ZyPerHD, ZyPerUHD or ZyPer4K units with only HDMI 1.4 support.

1.  Login to the ZMP. Refer to **Accessing ZMP (page 13)** for more information.

2.  Click the **Multiview** tab at the left of the page.

3.  In the **Multiview** pane, click on the **+** button to create a new video wall.

4.  This will bring up the Multiview editor where you can create and customize a multiview display.
5. Click on the **Patterns** button in the lower right corner to bring up a list of pre-defined patterns.

6. After selecting a pattern you will see the grid fill in with the places to drag sources.
7. Drag sources into the various locations. Note: The same source can be dragged into multiple windows as long as the windows are the same size. Dragging a source onto different size windows is NOT supported.
8. If desired, assign Audio from one of the Sources. This is done by clicking on one of the small Audio symbols in the top center of each Window. Note that only audio from one source is supported.

9. Give the Multiview a name and press the Save button.

10. To use the Multiview, drag the newly created multiview onto a Display in the Display pane.
Creating Zones

In many installations, displays are placed in more than one room. These rooms are often referred to as *zones*. Creating a *Zone*, using the Management Platform, allows you to organize these displays in a group. *Video Walls* can also be added to *Zones*.

1. Login to the ZMP. Refer to *Accessing ZMP (page 13)* for more information.

2. Click the *Zones* option at the left of the page.

3. In the Zones window, click on the `+` symbol to add a Zone.
4. This will open the Zones Editor. Drag Display and Video Walls into the Zone from the Displays or Walls windows.

5. Continue adding the desired displays (or video walls) to the drop-pane.

6. Provide a name for the Zone. If a custom name is used, it must not contain spaces. In this example, we will call our Zone, “ConferenceRm”, since our displays are installed in a conference room. It is recommended that a unique and descriptive name be used to identify each Zone.
7. Click the **Create** button to save the **Zone**. Close the editor window to exit without saving changes.

8. The new **Zone** will appear under the **Zones** window.

9. Zones are deleted by clicking on the small Trash Can icon. The user will be prompted to confirm deletion.

   **Are you sure?**

   Would you like to delete zone "1stfloor"?

   [Cancel]  [Delete]
Creating Presets and Schedules

Presets are snapshots of a system configuration at a given time. You can save presets to the system and return to these configurations manually or via the scheduling function.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the Presets option at the left of the page.

3. In the Presets/List window, click on the + symbol to add a Preset.
4. This will open the **Create Preset** window. Enter a name and description for this preset.

5. You can now Create the preset using the current state of the system. “Create with Existing Connections” or you can “Create with No Commands” and add the API commands manually.

6. The example above is “Create with Existing Connections”. Notice the relevant API commands to return to the current system state are listed under Commands: You can manually edit this list to add/remove/change commands as desired. Hit the Exit key when done creating the preset.
7. The created preset is now available. Options include, running the preset manually, editing the preset, scheduling the preset, showing a log of when preset was run and deleting the preset.

8. To add the preset to the schedule/calendar click the small calendar icon. (3rd icon in). This will open the window shown below. Click the + symbol to “Add Schedule”.

9. Assign a name to the schedule here. It can be the same as the preset name or something different. Select the date of the month - enter value 1 - 31. Please a checkmark next to All for everyday of the month. Day of the Week - Select day to run Preset by day of week, weekend, weekday, or all. Weekends are Saturday and Sunday, and Weekdays are Monday - Friday. Hour - Values range 0 - 23. Minute - values range 0 - 59. Select color for the preset to appear in the calendar page. Click Create when done.
10. In the example below the name of the Schedule is “Opening Time” and has been set to occur every day at 7am. Click the X next to “Schedule For Preset Morning” to exit this page.

11. This preset will now appear in the Calendar page.

12. You can add as many preset configurations to the calendar as you like. You also run the same preset at different days/times as desired.

**Note:** The following API commands are used to manually configure NTP servers or set the time for customers without Internet access or a local time server:

```
set server date ntpServer address <domainName>
set server date manual month <int> day <int> year <int> hour <int> minute <int>
```
13. The Calendar can be viewed in Month, Week, Day or Agenda mode.

Week Mode shown below:

Day Mode shown below:

Agenda Mode shown below:
**Source Grid Page**

This page is used to show all encoders in a text based grid. Information shown includes device name, type, MAC address, Model, IP address and EDID. The user can also export the entire contents of the Source Grid to a .CSV file.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the **Source Grid** option at the left of the page.

3. Source Device/Encoder information will be shown in a grid format. There are independent tabs for Status, Routing, Config, VideoIn, Network, EDID, Firmware and RS-232. You may want to close other windows to be able to maximize the size of the grid.
4. The Status tab shows basic information and allows a quick diagnostic by clicking the Diag button. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

5. The Routing tab allows you to manually route RS-232 and IR signals. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

6. The Config tab will let you change encoder names and manually restart or factory default the encoders. The user can also change icons associated with the encoder; including the ability to upload custom Icons. (JPG and PNG formats are both acceptable) Click the small arrow next to the Icon to bring up a menu of available options. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
7. The VideoIn tab shows information about connected source Color Space and Resolution. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

<table>

10. The Firmware tab will show the current version of firmware installed on the encoders and allow you to manually update to another version if needed. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

11. The RS-232 tab will show current RS-232 configuration settings and allow you to make changes. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
12. Exporting the Source Grid to a CSV file

Clicking on the 3 parallel bars from any tab in the Source Grid will allow you to save the Source Grid contents to a CSV file.

Select the Export/Import option.

Note that there is a check box in the upper left allowing you to select all columns to be exported. You can also individually select what columns you wish to export.

Once you click the Export CSV button, the file will be downloaded to your computer. The CSV file can be opened and viewed by many applications including Microsoft Excel.

The CSV can be edited and uploaded back into the system if desired. Using the process above, drag the edited CSV file into the “Load CSV data file” box and click the Import to Grid button.
Display Grid Page

This page is used to show all decoders in a text based grid. Information shown includes device name, type, MAC address, Model, IP address, EDID and Connected Encoder. The user can also export the entire contents of the Display Grid to a .CSV file.

Display Grid

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.
2. Click the Display Grid option at the left of the page.

3. Display Device/Decoder information will be shown in a grid format. There are independent tabs for Status, Routing, Config, VideoOut, Network, EDID, Firmware and RS-232. You may want to close other windows to be able to maximize the size of the grid. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
4. The Status tab shows basic information and allows a quick diagnostic by clicking the Diag button. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

5. The Routing tab allows you to manually route Video, Video Wall, USB, RS-232 and IR signals. Make changes by clicking into the small down arrow. Field will turn green indicating an upcoming change. Press the Apply button to implement the change. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

6. The Config tab will let you change decoder names and manually restart or factory default the decoders. It also lets you know what video port is active if more than one port is available and if the Analog audio output is being used. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
7. The VideoOut tab shows information about the resolution source, scaling mode, color space and active resolution. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

<table>
<thead>
<tr>
<th>Status</th>
<th>Routing</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

9. The EDID tab will show current EDID information for the connected display and allows the save the EDID to a file. Click the Save button to save the EDID. Note that both a text and binary version will be saved and available to the user. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
10. The Firmware tab will show the current version of firmware installed on the decoders and allow you to manually update to another version if needed. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

11. The RS-232 tab will show current RS-232 configuration settings and allow you to make changes. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
12. Exporting the Display Grid to a CSV file

Clicking on the 3 parallel bars from any tab in the Display Grid will allow you to save the Display Grid contents to a CSV file.

Select the Export/Import option.

Note that there is a check box in the upper left allowing you to select all columns to be exported. You can also individually select what columns you wish to export.

Once you click the Export CSV button, the file will be downloaded to your computer. The CSV file can be opened and viewed by many applications including Microsoft Excel.

The CSV can be edited and uploaded back into the system if desired. Using the process above, drag the edited CSV file into the “Load CSV data file” box and click the Import to Grid button.
Server Functions Page

The majority of this page is used to display general information about the Management Platform. In addition, this page provides controls for setting the EDID mode and rebooting or restarting the server. Server firmware can also be updated from this window. For detailed instructions on how to update the ZMP, please refer to appendix 5.

Server Information

This section provides information about the Management Platform, such as the host name, IP address, MAC address, version, serial number, uptime duration, and free memory.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the Server option at the left of the page.

3. Information about the Management Platform will be displayed in the Server pane.

<table>

Setting the EDID Audio Mode

EDID Audio setting will specify at the encoder if only raw PCM audio is acceptable to the system or if encoded/compressed audio formats are supported.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the Server tab at the left of the page.

3. EDID information will appear in the Server window under the Status information. You may need to scroll down in the window to see the EDID information.

Note: There is a check box at the bottom of the Server window for "Show advanced controls" This box must be checked to enabled changing of the EDID mode setting.
Server Reboot, Shutdown and Trouble Report

The Management Server can be rebooted or shut down from the Server window. Each option affects the Management Server in different ways, as listed below.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.
2. Click the Server tab at the left of the page.
3. Reboot and Shutdown options will appear in the Server window under the Status information. You may need to scroll down in the window to see these options.

4. Click the desired button under Actions.
   - **Reboot**
     Linux is rebooted.
   - **Shut Down**
     Shuts down the Management Server.
   - **Trouble Report**
     Generates a trouble report than can be provide to ZeeVee support.
Server License and Update

The License for the Management Server can be updated to increase the maximum number of supported endpoints and their Server software version can also be updated.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.
2. Click the Server tab at the left of the page.
3. Scroll down to the License option.

4. Record the Product ID number and provide this to ZeeVee. This ID is used by ZeeVee to generate the new license key when purchased by a customer.
5. Once received, you can enter a new license key as provided by ZeeVee to increase the limit on the number of endpoints. (Please contact ZeeVee support for additional information)
6. Please see the Appendix of this document for information on updating the Server Software. **Note:** In a redundant environment, Software must be updated on slave first, then switchover, then update on new slave. See online help section 15.2
Help Page

The Help page provides a help reference for each page within the ZMP.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.

2. Click the Help tab at the left of the page.

3. The Management Platform Help window will be displayed.

4. Click the desired section. As the mouse pointer moves over each section, the text will become underlined.
Users and Roles Pages

The **Users** page provides the ability to create additional users beyond the Administrator and in conjunction with the **Roles** page assign different access/abilities to each user.

1. Login to the ZMP. Refer to Accessing ZMP (page 13) for more information.
2. Click the **Users** tab and **Roles** tab at the left of the page.
3. The Management Platform **Users** and **Roles** windows will be displayed.

The first User shown in the Users window is Admin. The Admin account cannot be deleted and the name cannot be changed. You can however change the password from the default of “admin” to a password of your choosing.

Click on the edit icon within the Admin user. The following screen will appear and allow you to change the password.
Enter the new password on both the “Password” and “Password Validation” lines and then hit the “Save” button in the lower right corner.

It is recommended to record this new password in a secure location.
Adding a New User

To create a new user click on the “+” symbol in the Users window. The screen shown below will appear. Enter the Full Name, User ID and Password for the new user. You can keep this password or force the user to generate a new password the first time they login by clicking the “Force password change on next sign in” box.

Save the user by clicking the Save button in the lower right corner.
To create a new role click on the “+” symbol in the Roles window. The screen shown below will appear. In the General tab enter the Role Name. In the example below the name is “Junior Admin”.

The next thing you will need to do is assign Permissions to this new role. To do this click on the Permissions tab.
There are 10 categories that can be assigned different levels of access within the Permissions tab. Sources, Displays, Zones, Walls, Multiview, Logs, Help, Users, Roles and Server. Most categories have 2 or 3 levels of access:

**View:** User is allowed to access the designated tab within ZMP

**Config:** User is allowed to alter or create new configurations within the designated tab. For example the user can create a new Wall, Multiview or Zone.

**Admin:** User has full functional control over configurations, including ability to delete sources and displays.

Click on the appropriate levels of access to set permission. The process is color coded to make it easier. Green = Full access, Yellow = Partial access, Red = No access.

Be sure to Save any changes before moving to the step of assigning specific users these permission levels.
You need to have both the **Users** and **Roles** windows visible to assign a User with a set of Roles / Permissions. Open the Users tab in the Roles window and drag a specific User from the User window over. (Drag the “person” icon located to the far left next to user ID)

Be sure to Save any updates.

In example above, “Art” was dragged over to “Junior Admin” role. Be sure to Save this setting before closing the **Roles** window.
3 Advanced Operation
Accessing the API

Using Telnet

Telnet is a popular protocol that can be used on both Windows® and Mac OS® operating systems to connect to the programming shell. On a Windows operating system, a Telnet client, such as “PuTTY”, must be installed. From a Unix or Mac OS command line, use the telnet command followed by the IP address of the Management Platform:

telnet 192.168.1.6

Instead of specifying the IP address of the Management Platform, the following identifier can also be used: zyper.local

Example: telnet zyper.local

Telnet will use port 23 by default and once connected, the API prompt will be displayed:

Zyper$

Getting Help

To make it easier to find commands, help now supports groups.

- help – lists all groups
- help <group> -- lists commands within a group.

Note: The same command may appear in more than one group.

- help all byGroup – lists all groups and all commands in each group
- help all alphabetical – list all commands in alphabetical order

Help is available in two forms. Typing help or ? at the prompt will list all available commands:

Zyper$ help all alphabetical

Help All Commands Alphabetical
  add device ipAddress <ip>
  add snmp trapServer v2cTrap ipAddress <address:ip> community <string>
  ...
  ...
  update device <deviceNamePart>|all|encoders|decoders <filename>
  update server <filename>

Success
Zyper$
Zyper$ help
Help Groups

  VideoWall
  Zone
Enter `help <group>'`, or `help all byGroup'`, or `help all alphabetical'
Success

In addition, a partial list of commands can be listed by specifying the first word of each command. The first part of the command must be specified before the `help` command. For example, the following will only list command with the join prefix.

Zyper$ join help
join <encoderMac|encoderName>|none <decoderMac|decoderName|zoneName>.zoneName> analogAudio
join <encoderMac|encoderName>|videoSource|none <decoderMac|decoderName|zoneName>.zoneName> hdmiAudio
join <encoderMac|encoderName|multiviewName>|none <decoderMac|decoderName|zoneName>.zoneName> multiview
join <encoderMac|encoderName>|none <decoderMac|decoderName|zoneName>.zoneName> video|fastSwitched|genlocked|genlockedScaled
join <encoderMac|encoderName>|none <wallName> videoWall
join <encoderMac|encoderName>|none <decoderMac|decoderName|zoneName>.zoneName> us
join <encoderMac|encoderName>|none <decoderMac|decoderName> window
viewportSource <x:int> <y:int> <sizeX:int> <sizeY:int> viewportDest <x:int> <y:int> <sizeX:int> <sizeY:int>
Zyper$
Setting the Time Zone

The Management Platform can use the Network Time Protocol (NTP) to set the date and time. However, the time zone will need to be specified. Alternately the date and time can be set manually.

1. Telnet to the Management Platform.

   ```
telnet 192.168.1.6
   
```

2. After the connection has been established, use the `set server timezone` command to set the time zone.

   ```
Zyper$ set server timezone America/New_York
Success
Zyper$
   
```

   The time zone must be specified in POSIX format and is case-sensitive. Refer to the following link for more information:

3. To set date/time manually use the `set server date manual` command.

   ```
Zyper$ set server date manual  month 4 day 1 year 2021 hour 15 minute 1
Success
Zyper$
   `````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````````
EDID Management

Auto EDID Mode

By default, Auto EDID mode is *enabled*. This means that the Management Platform will compare the encoder EDID with the decoder EDID. If they are different, then the EDID from the decoder (sink) will be used by the encoder (source). Setting the EDID Mode affects all join modes: fast-switched, genlocked, and video-wall. Refer to the `join` command in the API Command Listing (page 84) section for more information.

Using Custom EDID Data

There may be some instances where a custom EDID is desired. One example is when using a single encoder with multiple displays, such as a *video wall*. In such a case, follow the steps below to save and load a custom EDID to the Management Platform.

1. Telnet to the Management Platform.
   
   \texttt{telnet 192.168.1.6}

2. Disable Auto EDID mode by entering the following command:
   
   \texttt{zyper$ set server auto-edid-mode disabled}
3. Use the `save device-edid` command to save the EDID of the sink device (attached to the decoder) to the Management Platform, using the following convention:

```
save device-edid [id] [filename]
```

Make sure to replace `[id]` with the identifier of the sink device containing the EDID you wish to capture. You can specify either a MAC address or a name identifier. Follow the identifier with the name of the EDID file. For example:

```
zyper$ save device-edid SonyXBR4 myEDID
```

4. After executing this command, two files will be created under the following directory:

```
/srv/ftp/files/myEDID
/srv/ftp/files/myEDID.txt
```

`myEDID` is a binary EDID data file in standard format. `myEDID.txt` contains the decoded EDID in standard ASCII text.

These files must remain in this directory when disabling Auto EDID mode.

5. To force a ZyPer encoder to use the saved EDID you need to have the MP load the binary EDID file onto the desired encoder.

```
zyper$ load encoder-edid [id] saved [filename]
```

Make sure to replace `[id]` with the identifier of the source device you want to load the EDID onto. You can specify either a MAC address or a name identifier. Follow the identifier with the name of the EDID file. For example:

```
zyper$ load encoder-edid BlueRay1 saved myEDID
```

6. To return to Auto EDID mode, for any reason, enter the following command at the prompt:

```
zyper$ load encoder-edid BlueRay1 auto
```

or

```
zyper$ set server auto-edid-mode enabled
```
Advanced Operation

Using AJAX/JSON

The AJAX/JSON programming interface allows developers to control the Management Platform within browser-based applications. All calls to the server are asynchronous post/receive operations using Javascript and do not require any specific HTML or CSS code. We will present two examples in this section: Login authentication and command request/response.

Login Authentication

There are two methods to authenticate with the server. The first and recommended method is to pass the username and password to \texttt{rcLogin.php}. The second method is to pass the username and password in every AJAX request.

Once the server accepts the username and password, it will generate a secure cookie called “userToken”. This cookie will expire one hour after the last AJAX command is received by the server. After the cookie expires, all other AJAX requests will result in a failed authentication until \texttt{rcLogin.php} is called again. The following code excerpt is from the \texttt{zyperLogin()} function within \texttt{zyper.html}:

```javascript
... xmlhttp=new XMLHttpRequest();
xmlhttp.onreadystatechange = function(){
  if (xmlhttp.readyState == 4 && xmlhttp.status == 200){
    procLoginResp(xmlhttp.responseText);
  }
} postdata = "";
postdata += encodeURIComponent(“serverSocketName”) + ‘=’ +
  encodeURIComponent(socketName) + ‘&’ +
  encodeURIComponent(“username”) + ‘=’ +
  encodeURIComponent(username) + ‘&’ +
  encodeURIComponent(“password”) + ‘=’ +
  encodeURIComponent(password) + ‘&’;
xmlhttp.open(“POST”, url, true);
xmlhttp.setRequestHeader(“Content-Type”, “application/x-www-form-urlencoded”);
xmlhttp.send(postdata);
}
```

The response is a string value. The variable \texttt{resp} can be “Success”, “Failed”, or “Server not running”.

```javascript
function procLoginResp(jsonData) {
  var resp = JSON.parse(jsonData);
  ...
  ...
}```
Advanced Operation

Command Request / Response

After login, any further commands are sent to the rcCmd.php

The following code excerpt sends an AJAX request to list all ZyPer encoders and decoders:

```javascript
function zt(){
    xmlhttp = new XMLHttpRequest();
    xmlhttp.open("POST", url, true);
    xmlhttp.setRequestHeader("Content-Type", "application/x-www-form-urlencoded");
    xmlhttp.onreadystatechange = function(){
        if (xmlhttp.readyState == 4 && xmlhttp.status == 200){
            procResp(xmlhttp.responseText);
        }
    }
    xmlhttp.send(encodeURIComponent("commands:show device-status all");
}
```

In this example, the `encodeURIComponent` function has two parts: The request type, which is `commands` and the command `show device-status all`. Refer to the `show device status` command for more information. Currently, `commands` is the only request type that is supported and only a single command can be supplied for each request.

Here, we handle the AJAX response:

```javascript
function procRespTest(jsonData){
    var jsData = JSON.parse(jsonData);
    # jsData.status may have the values:
    # “Success”
    # “Request failed authentication”
    # “Server not running”
    # “no commands provided”
    if (jsData.status == “Success”){
        var element = document.getElementById(“responseError”);
        element.innerHTML = jsData.responses[0].error;
        element = document.getElementById(“responseWarning”);
        element.innerHTML = jsData.responses[0].warning;
        element = document.getElementById(“numObjectsInResponse”);
        element.innerHTML = jsData.responses[0].text.length;
    } else{
        // Failed authentication
    }
}
```

The JSON data is decoded using the `JSON.parse()` method. In this example, information about the response data is displayed on the web page (HTML code not shown).
The JavaScript object that is returned is:

```javascript
var jsObj = {
    status: true | false;
    responses: [ {error: "errorText",
                   warning: "warningText",
                   text: [ { param1: "val1", parmN: "paramN" } ]
               }
             ];
};
```

The return value is an object that contains two members: `status` and `responses`. If the `status` member is not equal to "Success", then the `responses` member is not valid. If the request fails authentication, then the `status` value will be "Request failed authentication". Note that there may be other web-server level failures that can be returned in the `status` string.

The second member in the returned object, `responses`, which is an array of objects. Each of these objects contains three members: `error`, `warning`, and `text`. The `error` and `warning` members are strings. The `text` member is an array of objects with the desired parameters and values. If the `error` string is non-null, then the `warning` and `text` members will be null. If `text` is non-null, then the `warning` string may still be valid.

Currently, the `responses` member is always an array size of 1.
## Fast-Switched vs. Genlocked Mode

The ZyPer4K provides two uniquely different modes for joining video/audio between a source (encoder) and display (decoder). The chart below details the differences between these two modes.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Fast-Switched</th>
<th>Genlocked</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latency</td>
<td>1-frame of latency. (16-33ms depending on frame rate of source video)</td>
<td>0 frames of latency. Less than 100μs</td>
</tr>
<tr>
<td>Transition Appearance</td>
<td>Instantaneous if switching between sources at same resolution and frame rate</td>
<td>Visible blanking of display when switching between sources</td>
</tr>
<tr>
<td>Scaling</td>
<td>Automatic scaling up or down to preferred resolution of the display (As determined by display EDID)</td>
<td>Source is not scaled. What comes in at source is presented to display exactly as input. (Note: Special Genlock-scaled mode is available)</td>
</tr>
<tr>
<td>HDR</td>
<td>HDR input is automatically reduced to 8-bits at output</td>
<td>HDR input is maintained exactly as input at the output</td>
</tr>
<tr>
<td>Encoded Audio</td>
<td>AC3 or other encoded audio formats are passed from encoder to decoder (New in 2.0 release)</td>
<td>AC3 or other encoded audio formats are passed from encoder to decoder</td>
</tr>
<tr>
<td>Video Wall</td>
<td>Video walls are technically not supported in Fast-Switched mode. (Join command for walls defaults to Genlock-scaled)</td>
<td>Video walls are technically always in Genlock-scaled mode</td>
</tr>
<tr>
<td>Multiview</td>
<td>Multiview is supported in Fast-Switch mode</td>
<td>Multiview is not supported in Genlocked mode</td>
</tr>
<tr>
<td>USB, IR, RS232</td>
<td>None of these items are associated with Fast-Switched or Genlocked mode</td>
<td></td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>

</tr>
<tr>
<td>update server</td>
<td>Updates the Management Platform software. See <em>Updating the Software</em> <em>(page 249)</em> for more information.</td>
<td></td>
</tr>
</tbody>
</table>
add device

Used to manually add a device to the ZyPer Management Platform that are located on a different VLAN/Subnet than the ZMP itself.

A qualified network engineer should be involved in making these configuration updates and the network switch provider may need to be consulted to ensure support of needed features.

Syntax

add device ipAddress ip

Parameters

i

Type: IP Address

The IP address of the device

Example

add device ipAddress 192.168.10.81
Success

Detailed Example

The ZyPer4K Endpoints are located on VLAN 10 and the 192.168.10.X subnet. The ZyPer Management Platform is on VLAN 20 and the 192.168.20.X subnet.

The ZMP will automatically discover any ZyPer4K endpoints located on VLAN 20. The ZMP will NOT automatically discover any ZyPer4K endpoints located on VLAN 10. However, given the proper circumstances, the ZyPer4K endpoints on VLAN 10 can be manually added to the ZMP for control.

For this to work, the network MUST be configured to route traffic between VLAN 10 and VLAN 20. How to configure the network to allow routing between VLANs is beyond the scope this document and should be done by a qualified network engineer. A simple test to confirm routing is that a device in VLAN 10 can ping a device in VLAN 20.

The ZyPer4K endpoints need to have a known IP Address. The IP Address should either be assigned by a DHCP server or assigned statically.

ZyPer4K endpoints need to be added one at a time.

You can get a listing of all "user added" devices with the “show device userAdded” command.
add snmp

Creates an new SNMP user or trap server. (Please see Section 5 of this manual for additional details on SNMP support)

Syntax

add snmp arg name

Parameters

arg

Type: STRING

Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trapServer vc2Trap ipAddress &lt;address&gt; community &lt;comm&gt;</td>
<td>Add new trap server at the specified IP Address</td>
</tr>
<tr>
<td>user v2c accessLevel readOnly community</td>
<td>Add new SNMP user</td>
</tr>
<tr>
<td>user v3 accessLevel readOnly auth MD5 encrypted no username &lt;name&gt; password &lt;password&gt;</td>
<td>Add new SNMP user</td>
</tr>
</tbody>
</table>

name

Type: STRING

IP address of trapserver or name of new SNMP user (Password must be 8 to 127 characters)

Example

add snmp user v3 accessLevel readOnly auth MD5 encrypted no username john password abc12345
Success

add snmp trapServer v2cTrap ipAddress 192.168.0.231 community john
Success

Related Commands

delete snmp
show snmp
add zoneDisplay

Adds a display or video-wall to an existing zone.

Care should be taken that individual displays found within walls are not added to a Zone. This would result in the same display being in a zone more than once.

Syntax

add zoneDisplay id

Parameters

id

Type: `STRING` or `MAC Address`

The name or MAC address of the device. String names are case-sensitive.

Example

add zoneDisplay myWall
Success

Related Commands

create zone
delete zone
delete zoneDisplay
show zones
channel

Will cycle through all encoders (of the same type as the decoder) that have a number (channel) suffix, "_nnn", where nnn is an integer (channel).

If there are encoders with names: enc_1, enc_100, enc_50, then a decoder will cycle through them in the order: enc_1, enc_50, enc_100, then back to enc_1.
If there are no encoders (of the same type as the decoder) with the channel suffix, an error is returned.

Only fast-switch connection types is supported. If there was already a connection of some other type, it is changed to Fast-Switched.

If the decoder has no connection, the encoder with the lowest channel suffix will be connected using fast-switch.

If the decoder has a connection to an encoder that does not have the channel suffix, then it will connect to the encoder that has the lowest channel suffix.

Note: In Fast-Switch mode the join video-source <decoder> command must be used to set audio to follow video join. Otherwise audio will not follow the video during channel up/down command.

Syntax

channel direction <decoder-id>

Parameters

direction
  Type: STRING

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>up</td>
<td>cycle to next higher numbered encoder</td>
</tr>
<tr>
<td>down</td>
<td>cycle to next lower numbered encoder</td>
</tr>
</tbody>
</table>

decoder-id
  Type: STRING or MAC Address

  The name or MAC address of the decoder. String names are case-sensitive.

Example

channel up MyDecoder
Channel changed to Channel_2
Success

Related Commands

join videoSource
create multiview

Creates an empty multiview display. (ZyPer4K only) Once created, the new multiview will be listed under the Multiview menu within the built-in ZMP.

Use the set multiview command to set a source encoder to a specified location and size within the multiview.

Refer to Creating a Multiview Screen (page 42) for information on managing multiview displays in the built-in ZMP.

Syntax

create multiview name

Parameters

name

Type: STRING

The name of the multiview. The name of the multiview cannot exceed 255 characters in length. Names are case-sensitive.

Example

create multiview myMultiview
Success

Related Commands

delete multiview
delete multiviewWindow
set multiview
set multiview audioSource windowNumber
show multiviews config
show multiviews status
create presetNew

Creates a new preset. Once created, the new preset will be listed under the Preset menu within the built-in ZMP.

Syntax

create presetNew name commands connections

Parameters

name
  Type: STRING
  The name of the preset. The name of the preset cannot exceed 250 characters in length. Names are case-sensitive.

connections
  Type: STRING
  Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>empty</td>
<td>This preset has no commands or connections associated with it.</td>
</tr>
<tr>
<td>existingConnections</td>
<td>Use the current connections to generate the preset</td>
</tr>
</tbody>
</table>

Example

create presetNew EveningShutDown commands existingConnections
Success

Related Commands

create presetSchedule
delete preset
run preset
set preset
show preset
create presetSchedule

Inserts an existing preset into the schedule calendar. Once created, the item must be assigned months/days/time to execute. By default without further setting, the preset will be schedule to occur every hour of every day.

Use the `set preset zoneDisplay` command to assign description, commands and schedule to the new schedule.

Syntax

```
create presetSchedule presetname schedule name
```

Parameters

`presetname`
- Type: **STRING**
- The name of an existing preset.

`name`
- Type: **STRING**
- The name of the schedule. The name of the schedule cannot exceed 250 characters in length. Names are case-sensitive.

Example

```
create presetSchedule EveningShutDown schedule GoHome
Success
```

Related Commands

- `create presetNew`
- `delete preset`
- `run preset`
- `set preset`
- `show preset`
create videoWall

Creates an empty 2x2 video wall. Once created, the new video wall will be listed under the Display Config menu within the built-in ZMP.

Use the join videoWall command to assign a source encoder to the wall. To modify the size of the video wall and/or control bezel parameters, use the set videoWall command.

Refer to Creating Video Walls (page 37) for information on managing video walls in the ZMP.

Syntax

create videoWall name

Parameters

name 
Type: STRING

The name of the video wall. The name of the video wall cannot exceed 255 characters in length. Names are case-sensitive.

Example

create videoWall myWall
Success

Related Commands

delete videoWall
set videoWall
**create zone**

Creates an empty zone. Once created, the new zone will be listed under the **Zones** menu within the built-in ZMP.

Use the `add zoneDisplay` command to assign decoders or video walls to the zone.

**Syntax**

```
create zone name
```

**Parameters**

*name*

Type: **STRING**

The name of the zone. The name of the zone cannot exceed 255 characters in length. Names are case-sensitive.

**Example**

```
create zone Zonel
Success
```

**Related Commands**

- `add zoneDisplay`
- `delete zone`
- `delete zoneDisplay`
- `show zones`
**dataConnect**

Connects two devices for IR or RS232 communication over a specified TCP port. *(Note TCP port only valid for connection between device and server. Not valid for connection between 2 devices)*

The feature of dataConnect was added to allow a third party to connect to the ZMP server with a specific port and pass raw or telnet API commands (depending on the mode) to the server and port which is designated for a particular encoder or decoder.

**Syntax**

dataConnect id1 id2 mode tunnelPort port

**Parameters**

**id1**

Type: STRING

The name of the first device. String names are case-sensitive.

**id2**

Type: STRING

The name of the second device or server. String names are case-sensitive.

**mode**

Type: STRING

ir or rs232

**port**

Type: INTEGER

TCP-Port #. Integer range from 1,024 to 49,152

**Example**

dataConnect MediaPlayer server rs232 tunnelPort 2345

tunnel TCP port = 2345; telnet handshake mode

Success

**Related Commands**

show dataTunnels
set server dataTunnelMode
delete allConfiguration

Deletes all device and server information from the Management Platform. The network configuration is preserved.

Syntax

delete allConfiguration action

Parameters

action

Type: STRING

Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reboot</td>
<td>Unit is automatically rebooted</td>
</tr>
<tr>
<td>restart</td>
<td>The ZyPer server service is restarted</td>
</tr>
<tr>
<td>shutdown</td>
<td>Unit is shutdown</td>
</tr>
</tbody>
</table>

Example

delete allConfiguration restart
delete allConfiguration reboot

Related Commands

factoryDefaults device
delete device

Deletes the specified device from the Management Platform database.

Note that if the deleted device remains on the network, then it will be rediscovered by the Management Platform and reposted to the database. To permanently remove a device from the database, physically disconnect it and execute the `delete device` command.

Syntax

```
delete device id
```

Parameters

`id`

Type: `STRING` or `MAC Address`

The name or MAC address of the device. String names are case-sensitive.

Example

```
delete device myDevice
Success
```

```
delete device 0:1e:c0:f6:42:a1
Success
```

Related Commands

`factoryDefaults device`
**delete multiview**

Deletes the specified multiview from the database on the Management Platform. *(ZyPer4K only)*

**Syntax**

```plaintext
delete multiview name
```

**Parameters**

- **name**
  
  **Type:** STRING

  The name of the multiview. Names are case-sensitive.

**Example**

```plaintext
delete multiview myMultiview
Success
```

**Related Commands**

- create multiview
- delete multiviewWindow
- set multiview
- set multiview audioSource windowNumber
- show multiviews config
- show multiviews status
**delete multiviewWindow**

Deletes the specified window from an existing multiview. *ZyPer4K only*

**Syntax**

`delete multiviewWindow name window arg`

**Parameters**

- **name**
  - Type: STRING
  - The name of the multiview. Names are case-sensitive.

- **arg**
  - Type: INTEGER
  - Window number to remove. Integer range from 1 to 9

**Example**

`delete multiviewWindow myMultiview window 5`

**Success**

**Related Commands**

- create multiview
- delete multiview
- set multiview
- set decoder multiview audioSource windowNumber
- show multiviews config
- show multiviews status
delete preset

Deletes the specified preset, preset runlog or preset schedule from the system.

**Note:** Runlog is history of when the preset has been executed. Deleting the runlog does not impact the preset itself or the schedule.

**Syntax**

```
delete preset name
delete preset name runLog
delete preset name schedule schname
```

**Parameters**

- **name**
  - Type: **STRING**
  - The name of the preset. Names are case-sensitive.

- **schname**
  - Type: **STRING**
  - The name of the preset schedule. Names are case-sensitive.

**Examples**

```
delete preset lunch runLog
Success
```

```
delete preset lunch schedule eat
Success
```

**Related Commands**

- create preset
- run preset
- set preset
- show preset
**delete snmp**

Deletes an existing SNMP user or trap server. *(Please see Section 5 of this manual for additional details on SNMP support)*

**Syntax**

delete snmp arg name

**Parameters**

*arg*

*Type: STRING*

Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trapServer vc2Trap ipAddress</td>
<td>Delete trap server at the specified IP Address</td>
</tr>
<tr>
<td>&lt;address&gt; community &lt;comm&gt;</td>
<td>Delete SNMP user</td>
</tr>
<tr>
<td>user v2c</td>
<td>Delete SNMP user</td>
</tr>
<tr>
<td>user v3</td>
<td>Delete SNMP user</td>
</tr>
</tbody>
</table>

*name*

*Type: STRING*

IP address and community of trapserver or name of new SNMP user

**Example**

delete snmp trapServer v2cTrap 192.168.0.231 community john
Success

delete snmp user v3 username john
Success

**Related Commands**

add snmp
show snmp
delete videoWall

Deletes the specified video wall from the database on the Management Platform.

Syntax

delete videoWall name

Parameters

name

Type: STRING

The name of the video wall. Names are case-sensitive.

Example

delete videoWall myWall
Success

Related Commands

create videoWall
set videoWall
**delete zone**

Deletes the specified zone from the database on the Management Platform.

**Syntax**

```
delete zone name
```

**Parameters**

*name*

Type: **STRING**

The name of the zone. Names are case-sensitive.

**Example**

```
delete zone zone1
Success
```

**Related Commands**

*add zoneDisplay*
*create zone*
*delete zoneDisplay*
*show zones*
**delete zoneDisplay**

Deletes the specified display from an existing zone.

**Syntax**

`delete zoneDisplay name id`

**Parameters**

`name`  
Type: `STRING`  
The name of the zone. Names are case-sensitive.

`id`  
Type: `STRING` or `MAC Address`  
The name or MAC address of the decoder/display. String names are case-sensitive.

**Example**

`delete zoneDisplay myzone mydisplay1`

Success

**Related Commands**

`add zoneDisplay`
`create zone`
`delete zone`
`show zones`
**diagnostics device**

Runs a set to test diagnostics on the specified device

**Syntax**

diagnostics device id

**Parameters**

id  
Type: **STRING** or **MAC Address**

The name or MAC address of the device. String names are case-sensitive.

**Possible Results**

**Decoder/Encoder:**

error, Device is down  
warning, Device has no HDMI link  
warning, Device rebooted %d times in the last minute  
warning, Device rebooted %d times in the last hour  
warning, Device rebooted %d times in the last day

**Decoder:**

error, HDMI Audio stream connection without video connection.  
warning, HDCP is forced on, but may not be supported by display device (however it is unlikely)  
error, Decoder has never received a valid EDID  
warning, Decoder resolution exceeds display EDID maximum -- very likely this will not work  
warning, Decoder using encoder resolution, which may not be display’s preferred based on its EDID  
warning, Decoder using encoder resolution AND ignoring display EDID, which may allow resolution to exceed display capability  
warning, Decoder using user-defined resolution, which may allow resolution to exceed display capability  
error, Encoder down  
warning, Encoder hdmi down  
error, Encoder has multiview conflict with genlock  
warning, Encoder stream disabled  
warning, Video stream interrupted %d times in the last minute, indicating likely network problem  
warning, Video stream interrupted %d times in the last hour, indicating likely network problem  
warning, Video stream interrupted %d times in the last day, indicating possible network problem  
warning, Encoder and decoder fps are not equal -- will result in very bad video  
warning, Encoder and decoder fps are not equal -- will result in very bad video  
warning, Encoder and decoder fps are not equal, but multiple of 2; this may still produce bad video  
warning, Encoder and decoder HDCP versions are not the same  
info, Encoder HDCP is disabled; this will prevent copyrighted material from display  
info, Encoder HDCP is set to version 1.4; this may prevent copyrighted material from display

**Encoder:**

info, HDCP is disabled; this will prevent copyrighted material from display  
info, HDCP is set to version 1.4; this may prevent copyrighted material from display
Examples

diagnostics device Top-Right
device(d8:80:39:9a:7f:ec);
  device.diags.summary; status=complete, error=0, warning=0, info=0
Success

diagnostics device ABC
device(d8:80:39:9a:96:7);
  device.diags.info.1; message=HDCP is disabled; this will prevent copyrighted material from display
  device.diags.summary; status=complete, error=0, warning=0, info=1
Success

diagnostics device encoder1
device(34:1b:22:80:26:2a);
  device.diags.warning.1; message=Device has no HDMI link
  device.diags.summary; status=complete, error=0, warning=1, info=0
Success

diagnostics device MyEncoder
device(34:1b:22:80:63:9c);
  device.diags.error.1; message=Device is down
  device.diags.summary; status=complete, error=1, warning=0, info=0
Success

diagnostics device MeetingRoom6
device(34:1b:22:80:57:7d);
  device.diags.error.1; message=Device is down
  device.diags.info.1; message=No video connection
  device.diags.warning.1; message=HDCP is forced on, but may not be supported by display device (however it is unlikely)
  device.diags.error.2; message=Decoder has never received a valid EDID
  device.diags.summary; status=complete, error=2, warning=1, info=1
Success
**events**

Causes the events mode to be entered.

**Syntax**

```
events
```

Server sends initial events and new events as they occur to the telnet session. Any character entered to the server causes the mode to exit back to the API prompt.

See Section 4 of this document for additional details on the events feature.
factoryDefaults device

Set the specified device to the factory-default settings.

Syntax

factoryDefaults device id

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the device. String names are case-sensitive.

Example

factoryDefaults device Airshow
Success

factoryDefaults device 0:1e:c0:f6:a8:c3
Success

Related Commands

delete allConfiguration
**flashLeds**

Physically identifies the specified device on the network. When this command is executed, the fiber LED indicators on the device will flash for 5 seconds. *(ZyPer4K only)*

**Syntax**

flashLeds id

**Parameters**

*id*

Type: **STRING or MAC Address**

The name or MAC address of the device. String names are case-sensitive.

**Example**

flashLeds myEncoder
Success

flashLeds 0:1e:c0:f6:59:13
Success
### join

Joins the specified decoder (display) with the specified encoder (source). The `mode` parameter must be specified and defines the type of join to execute.

- **analogAudio**
  - Embeds analog audio stream from the encoder on the output of the decoder. The audio is from the (analog) Audio jack on the encoder. In order to control what type of audio is being output from the decoder, refer to the `set decoder AnalogAudioOut` command.

- **fastSwitched**
  - Allows the joining of an encoder and decoder with no video dropout. In order to make use of this feature, the resolution and frame rate of the “new” encoder must be the same as the previous encoder.

- **genlocked**
  - This mode provides a very low-latency, all-purpose method of joining an encoder and decoder. *(ZyPer4K only)*

- **genlockedScaled**
  - This mode provides a very low-latency, all-purpose method of joining an encoder and decoder that includes scaling up or down at the decoder/display.

- **hdmiAudio**
  - Embeds hdmi-downmix audio from an encoder to specified decoder.

- **multiview**
  - Join the configured multiview to a display (decoder) *(ZyPer4K only)*

- **video**
  - Joins video only from encoder to decoder. No audio.

- **videoWall**
  - Join the encoder to the named video-wall

- **window**
  - Join any portion of a source to any portion of a display

- **usb**
  - Creates USB connection between encoder and decoder. Note that multiple connections are valid.

- **none**
  - Special command to disconnect existing connections (joins) Example: `join none decoder fastSwitched`

### Syntax

```bash
join enc dec mode
join none dec fastSwitched
```
Parameters

enc
Type: STRING or MAC Address

The name or MAC address of the encoder. String names are case-sensitive.

dec
Type: STRING or MAC Address

The name or MAC address of the decoder. Can also be name of existing video-wall. String names are case-sensitive.

zone
Type: STRING

The name of an existing zone. String names are case-sensitive.

mode
Type: STRING

Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analogAudio</td>
<td>Embed audio from the specified encoder</td>
</tr>
<tr>
<td>fastSwitched</td>
<td>Join in “fast-switched” mode</td>
</tr>
<tr>
<td>genlocked</td>
<td>Low-latency join mode (ZyPer4K only)</td>
</tr>
<tr>
<td>genlockedScaled</td>
<td>Low-latency with scale up/down (ZyPer4K only)</td>
</tr>
<tr>
<td>hdmiAudio</td>
<td>Join hdmi-audio to either hdmi-out or analog-out. Note this command will cause hdmiAudioFollowVideo=False for specified decoder. See join videoSource command on next page.</td>
</tr>
<tr>
<td>multiview</td>
<td>Join a multiview to a display (ZyPer4K only)</td>
</tr>
<tr>
<td>videoWall</td>
<td>Join a source to a video-wall</td>
</tr>
<tr>
<td>video</td>
<td>Join video only (audio not joined)</td>
</tr>
<tr>
<td>window</td>
<td>Join any portion of a source to any portion of a display (ZyPer4k only)</td>
</tr>
<tr>
<td>usb</td>
<td>Establish USB connection</td>
</tr>
<tr>
<td>“none”</td>
<td>Disconnect existing joins</td>
</tr>
</tbody>
</table>

Notes:
Multiviews cannot be joined to a zone.
USB cannot be joined to a zone.
Examples

join myEncoder1 myDecoder2 fastSwitched
Success

join myEncoder1 myDecoder2 hdmi-audio
Success

join myMultiview2 Display4 multiview
Success

join myEncoder1 myWall videoWall
Success

join none myDecoder1 fastSwitched

Window Example

join myEncoder1 myDecoder2 window viewportSource 0 0 1920 1080
viewportDest 500 500 500 500

(ViewportSource parameters are starting X/Y coordinates of the
source and desired X/Y size)

(ViewportDest parameters are starting X/Y coordinates in the
display and desired X/Y size)
join videoSource

Tells a decoder to automatically join corresponding audio from a source encoder whenever a join command is used to join video.

Syntax

join videoSource dec mode

Parameters

dec

Type: **STRING** or **MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

mode

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audio</td>
<td>automatically join audio from connected encoder (ZyPerUHD only)</td>
</tr>
<tr>
<td>hdmiAudio</td>
<td>automatically join hdmi-audio from connected encoder (ZyPer4K only)</td>
</tr>
</tbody>
</table>

Example

join videoSource MyDecoder hdmiAudio
Success

Related Commands

join hdmiAudio
**load encoderEdid**

Uploads an EDID file to the specified encoder.

**Important Note:** Auto-EDID mode should be disabled when loading a specific EDID to an encoder. Otherwise the loaded EDID will immediately get replaced by the Auto-EDID option.

**Syntax**

`load encoderEdid enc mode file`

**Parameters**

**enc**

Type: **STRING** or **MAC Address**

The name or MAC address of the encoder. String names are case-sensitive.

**mode**

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>use whatever EDID information is provided by connected decoder</td>
</tr>
<tr>
<td>builtIn</td>
<td>use one of the EDID files provided by ZeeVee. Many options available covering various 4k settings. See list below.</td>
</tr>
<tr>
<td>saved</td>
<td>use a file that user has previously saved to the system with the save device-edid command</td>
</tr>
</tbody>
</table>

**file**

Type: **STRING**

The name of the file to load.

load encoderEdid myEncoder builtIn zyper4k60
Success

Related Commands

save deviceEdid
set server autoEdidMode
logging

Used to set the level of detail captured by Trouble Reports and manually add text notes into log for Trouble report. To be used at direction of ZeeVee support team to aid in troubleshooting of issues.

Syntax

logging level arg

Parameters

arg
Type: INTEGER
Logging Level. Integer range from 1 to 4

Example

logging level 2
Success

Syntax

logging note string

Parameters

string
Type: text
String with length from 1 to 132 characters

Example

logging note “my inserted text”
Success
**previewStream**

Used to turn on/off a small thumbnail size preview stream that is viewable in the ZyPer Management Platform GUI. (ZyPer4K and ZyPerUHD only) **Note:** Preview streams are not supported by the ZyPer4K-XS and ZyPer4K-XR

**Syntax**

```
previewStream enc arg comp width size
```

**Parameters**

- **enc**
  
  **Type:** STRING or MAC Address
  
  The name or MAC address of the encoder. String names are case-sensitive.

- **arg**
  
<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stop</td>
<td>used to manually stop the preview stream. Note that it can turned back on from the GUI</td>
</tr>
<tr>
<td>start</td>
<td>used to manually start the preview stream.</td>
</tr>
</tbody>
</table>

- **comp**
  
<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hls</td>
<td>set the format of the preview stream to HLS</td>
</tr>
<tr>
<td>jpeg</td>
<td>set the format of the preview stream images to JPEG</td>
</tr>
</tbody>
</table>

- **size**
  
  **Type:** Integer
  
  Width of the preview stream in pixels. (180 to 400)
Example

previewStream MyEnc start hls width 300
BWG: After Start Preview Streams running = 3
Success

previewStream MyEnc stop
Success

HLS Notes

A maximum of 20 preview streams may be enabled at a single time.

ZyPer4K devices must be on firmware release 4.0.1.0 or newer for this feature to work.

The HLS stream can be viewed by any HLS capable viewer such as a browser. The path needed is shown below:

http://mp_ip_address/media/encoder_mac_address.m3u8

mp_ip_address is the IP address of the ZyPer Management Platform
encoder_mac_address is the MAC address of the Z4K encoder

Example

http://192.168.0.78/media/d8:80:39:eb:1c:ee.m3u8

JPEG Notes

JPEG images cannot be viewed in the ZyPer Management Platform GUI. This feature is intended for 3rd party control systems to grab individual JPEG images. (1 per second)

The JPEG images can be viewed by any JPEG capable viewer such as a browser. They can also be directly downloaded to a system. The path needed is shown below:

http://mp_ip_address/media/encoder_mac_address.jpeg

mp_ip_address is the IP address of the ZyPer Management Platform
encoder_mac_address is the MAC address of the Z4K encoder

Examples

http://192.168.0.78/media/d8:80:39:eb:1c:ee.jpeg

**redundancy switchover**

If there is an active slave, this command causes the existing master to become the slave and the existing slave to become the master. The server does not restart or re-initialize any other state, including any existing video and audio connections.

The IP address that is always assigned to the master. If the active slave becomes the master, this IP address will then terminate at that system. Note that any existing TCP connection will terminate and have to be reopened (to the new master).

**Syntax**

```
redundancy switchover
```

**Parameters**

`none`

**Example**

```
redundancy switchover
Success
```

**Related Commands**

`set server redundancy`
`redundancy delete downServers`
**redundancy delete downServers**

Cleans up and removes any redundant servers from server list that are no longer available in the system.

**Syntax**

redundancy delete downServers

**Parameters**

none

**Example**

redundancy delete downServers
Success

**Related Commands**

set server redundancy
redundancy switchover
restart device

Restarts the specified device.

Syntax

restart device id

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the device. String names are case-sensitive.

Example

restart device myEncoder2
Success

restart device 0:1e:c0:f6:cb:76
Success

Related Commands

restart server
restart server

Restarts the server. Linux is not restarted.

Syntax
restart server

Parameters
none

Example
restart server
Success

Related Commands
restart device
**restore server database**

Restores a stored server database from file. (Stored on the ZyPerMP hardware)

**Important Note:** Saved database to be restored MUST have been created using the exact same version of API that is currently running.

**Syntax**

```
restore server database name
```

**Parameters**

- **name**  
  
  **Type:** STRING  
  
  The name of the stored database. Names are case-sensitive.

**Example**

```
restore server database jan16_2019
Loaded database jan16_2019; restarting server
Success
```

**Related Commands**

- `save server database`
**revert server**

Returns to a previously installed version of the API and device database.

This feature can be used to go back to a previous software version and database version in case of a failed software upgrade. Primarily used to recover previous state if something goes wrong.

**Syntax**

revert server

**Note:** The show server info command will identify the Previous Version that will be restored to the system.

**Example**

revert server
Reverting from update_nuc_1.8.34605.zyper to update_nuc_2.0.34928.
zyper
Success

**Related Commands**

show server info
run preset

Manually executes an existing preset

Syntax

run preset name

Parameters

name

Type: STRING

The name of the existing preset. Names are case-sensitive.

Example

run preset lunch
Success

run preset closing
Success

Related Commands

create preset
delete preset
set preset
show preset
save deviceEdid

Saves the EDID of the downstream sink to the srv/ftp/files folder on the Management Server. Executing this command will generate two file types: .bin and .txt. The .bin file is the EDID in standard format. The .txt file is the decoded EDID data. See Using Custom EDID Data (page 79) for more information on using this command.

Syntax

save deviceEdid id file

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the decoder that is connected to the sink device. String names are case-sensitive.

file

Type: STRING

The name of the EDID file. Two files will be created using the file name: .txt and a file with no extension.

Example

save deviceEdid 0:1e:c0:f6:a5:2f myEDID
Success

Related Commands

load encoderEdid
set server autoEdidMode
save server database

Saves the current MP database to a file. (Stored on the ZyPerMP hardware)

Syntax

save server database name

Parameters

name

Type: STRING

The name of the database. Names are case-sensitive.

Example

save server database jan16_2019
Saved database to jan16_2019
Success

Related Commands

restore server database
**save system config**

Saves the current system configuration to a file. (Stored on the ZyPerMP hardware)

**Syntax**

```plaintext
save system config name
```

**Parameters**

```plaintext
name
```

Type: **STRING**

The name of the file. Names are case-sensitive.

**Example**

```plaintext
save system config march24
Saved config to /srv/ftp/files/march24
Success
```

**Related Commands**

```plaintext
save server database
restore server database
```
**script**

Executes the specified script. The script must exist in the /srv/ftp/files folder. Use the optional `loop` argument to place the script in a loop. The script will continue running until a key is pressed on the keyboard.

**Syntax**

```
script file [loop]
```

**Parameters**

`file`

Type: **STRING**

The name of the script file.

**Example**

```
script myScript
Success
```

**Related Commands**

`sleep`
**send**

Sends an IR, RS232 or CEC string to the specified device. Use the `type` parameter to specify an IR, RS232 or CEC code.

**Syntax**

```
send id type text
```

**Parameters**

- **id**
  - **Type:** STRING or MAC Address
  - The name or MAC address of the device.

- **type**
  - **Type:** STRING
  - Specifies IR, CEC or RS232 command

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ir</td>
<td>The string must be the hex representation of the binary data. (Pronto code) The maximum length for a string is 256 characters. (ZyPer4K only)</td>
</tr>
<tr>
<td>cec</td>
<td>on</td>
</tr>
<tr>
<td>cec hexString</td>
<td>hex-numerals-no-delimiters (ZyPer4K only)</td>
</tr>
<tr>
<td>rs232</td>
<td>The string is ASCII and must not exceed 256 characters in length. Spaces and the following control characters are supported as a portion of the string:</td>
</tr>
<tr>
<td></td>
<td>\n</td>
</tr>
<tr>
<td></td>
<td>\r</td>
</tr>
<tr>
<td></td>
<td>\t</td>
</tr>
<tr>
<td></td>
<td>\</td>
</tr>
<tr>
<td></td>
<td>\xnn</td>
</tr>
</tbody>
</table>

- **text**
  - **Type:** STRING
  - The string to send. See the table, above, for restrictions.
Example

send myDecoder2 ir 0000006900000015005f00170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000170030001700300017003000200
Success

send myDecoder2 rs232 ZeeVee_support_is_the_greatest\r\nSuccess

send myDecoder2 cec on
Success

send myDecoder2 cec off
Success

Important Notes

CEC is not supported on ZyPerHD

CEC functionality on the ZyPer4K is only supported with hardware firmware version 3.5.2 and newer.

CEC hexString command is not supported on ZyPerUHD

Related Commands

set device rs232
set encoder analogAudioOut

Sets the analog audio output source type for the specified encoder. (ZyPer4K and ZyPerUHD only)

Syntax

set encoder id mode type

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the encoder. String names are case-sensitive.

mode

Type: STRING

The audio output to use.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analogAudioOut</td>
<td>Audio output from the Audio port on the Encoder.</td>
</tr>
</tbody>
</table>

type

Type: STRING

The audio mode (analog or HDMI).

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source none</td>
<td>No analog audio output from the encoder</td>
</tr>
<tr>
<td>source hdmiAudioDownmix</td>
<td>Uses downmixed audio from input HDMI stream.</td>
</tr>
</tbody>
</table>

Example

set encoder Myencoder1 analogAudioOut source hdmiAudioDownmix
Success
set encoder edid audio

Sets the allowable audio input formats at the encoder. *(ZyPer4K and ZyPerUHD only)*

Detailed Background

ZeeVee added a feature that will allow compressed formats to be passed down in an encoder EDID file. This EDID will be then forwarded to the source device to determine the type of audio sent to the encoder.

This enhancement was to provide fast-switched connections the "compressed audio" options in the EDID file. Prior to this version with the fast-switched connection, ZeeVee modified the EDID passed from the decoder to the encoder and removed all compression formats. This left just LPCM as the only option under the “Audio data block” in the edid file.

>>> Audio data block <<<

Linear PCM, max channels 8
  Supported sample rates (kHz): 192 176.4 96 88.2 48 44.1 32
  Supported sample sizes (bits): 24 20 16

The information provided to the Video Source device (such as BluRay Player or Media player) increases the possibility of compression being a chosen audio format. However it is still up to the device to choose uncompressed or compressed formats. It is important to know that some devices such as the Apple 4K TV requires the audio output type to be set (even if the audio format is available in the EDID). Compression will need to be set manually on these types of devices.

In addition any downmixed stream internal to ZyPer devices will not process compressed audio, so you will not hear compressed audio on these connections.

Syntax

```
set encoder id edid audio mode
```

Parameters

`id`

Type: **STRING or MAC Address**

The name or MAC address of the encoder. String names are case-sensitive.
mode

Type: STRING

The supported input audio mode

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>onlyPcm</td>
<td>Force PCM audio format at encoder. Does not allow compressed formats such as AC3.</td>
</tr>
<tr>
<td>allowCompressed</td>
<td>Passes the decoders edid with unmodified audio information and thus allows compression options to be seen.</td>
</tr>
<tr>
<td>serverDefault</td>
<td>Follows the server setting</td>
</tr>
</tbody>
</table>

Example

set encoder Cuba edid audio allowCompressed
Success

Related Commands

set server encoderDefaultAudioFormat

Additional Information

In an attempt to properly identify the Audio Streams used under the product the following changes were also made along with some modification to the API commands.

<table>
<thead>
<tr>
<th>Product</th>
<th>Old Audio Stream Name</th>
<th>New Stream Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZyPer4K</td>
<td>hdmi (used in genlocked mode)</td>
<td>hdmiPassthroughAudio</td>
</tr>
<tr>
<td>ZyPer4K</td>
<td>hdmi-audio-downmix</td>
<td>hdmiAudio</td>
</tr>
<tr>
<td>ZyPer4K</td>
<td>analog-audio</td>
<td>analogAudio</td>
</tr>
<tr>
<td>ZyPerUHD</td>
<td>audio</td>
<td>hdmiAudio</td>
</tr>
<tr>
<td>ZyPerUHD</td>
<td>analog-audio</td>
<td>analogAudio</td>
</tr>
<tr>
<td>ZyPerHD</td>
<td>Part of fast-switched connection</td>
<td>No Change</td>
</tr>
<tr>
<td>ZyPerHD</td>
<td>Part of fast-switched connection</td>
<td>No Change</td>
</tr>
</tbody>
</table>
The ZyPer4k can have analog and digital audio streams going to the decoder at the same time and routing either way.

So:

join <enc> <dec> hdmiAudio

is simply used to route ‘standard’ HDMI audio from encoder to decoder.

Which port it goes out is based on defaults or the set command.

Zyper$ set decoder z4k_dec_desk_58 analogAudioOut source
   analogAudio
   hdmiAudioDownmix

or

Zyper$ set decoder z4k_dec_desk_58 hdmiAudioOut source
   analogAudio
   hdmiAudio (For HDMI out only)
   hdmiAudioDownmix
   hdmiPassthroughAudio (This is for genlockonly)
set encoder hdcpMode

Sets the hdcp mode for the specified encoder.

Syntax

set encoder id mode type

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the encoder. String names are case-sensitive.

mode

Type: STRING

The hdcp mode to use

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hdcpMode</td>
<td>HDCP mode of the Encoder.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>encoder will accept HDCP 1.4/2.2 compatible streams. Also will accept unencrypted inputs.</td>
</tr>
<tr>
<td>enabled1_4</td>
<td>encoder will accept HDCP 1.4 compatible streams. Also will accept unencrypted inputs.</td>
</tr>
<tr>
<td>disabled</td>
<td>encoder will reject HDCP 1.4/2.2 compatible streams. Will only accept unencrypted inputs.</td>
</tr>
</tbody>
</table>

Example

set encoder Myencoder1 hdcpMode disabled

Success

Notes

Useful when user does not want Source such as Apple Macbook to provide HDCP protected content to the Encoder.
set decoder

Sets the audio output type and video timing details for the specified decoder.

Syntax

set decoder id mode type

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the decoder. String names are case-sensitive.

mode

Type: STRING

<table>
<thead>

</tr>
<tr>
<td>pixelsHoriz</td>
<td>Width in pixels or auto</td>
</tr>
<tr>
<td>pixelsVert</td>
<td>Height in pixels or auto</td>
</tr>
<tr>
<td>fps</td>
<td>Frames per second</td>
</tr>
<tr>
<td>source</td>
<td>Match decoder resolution to source input size</td>
</tr>
<tr>
<td>auto</td>
<td>automatically based on EDID</td>
</tr>
</tbody>
</table>

**Command Description**: Override output display size and fps

```
set decoder <Decoder_Name or MAC> displayResolution activeSize <int> pixelsHoriz <int> pixelsVert <int> fps <int>|source
```

This command allows an override of EDID parameters supplied by the display. Regardless of what the supplied EDID indicates, the decoder will generate a stream with specified overall size and frame rate parameters.

Note that in "genlock-scaled" mode, the frame rate parameter is ignored – it must be the same as the encoder frame rate. This does mean care must be taken when setting this parameter if the source stream is 60fps (e.g. 720p60fps) and scaled to 4K. That only works if the display supports 4K60.
If configured resolution specification in these parameters that exceed the displayed maximum resolution, the display will black out with no indication to the user.

Example command:
Zyper$ set decoder Dec1 displayResolution activeSize 3840 2160 fps 60

**Command Description:** Output display size determined by received EDID

**Command Syntax**
set decoder <Decoder_Name or MAC> displayResolution auto

The command causes the decoder to set output display size to the “preferred” value in the EDID received from the display.

**Command Description:** Override detailed video parameters

**Command Syntax**
set decoder <decoderMac|decoderName> displayAdvancedTiming activeSize <pixelsHoriz:int> <pixelsVert:int> fps <float> total-size <pixelsHoriz:int> <pixelsVert:int> syncFrontPorch <pixelsHoriz:int> <pixelsVert:int> syncWidth <pixelsHoriz:int> <pixelsVert:int> syncPolarity hPositive|hNegative vPositive|vNegative

This command allows an override of EDID parameters supplied by the display. Regardless of what the supplied EDID indicates, the decoder will generate a stream with specified detailed timing parameters.

If configured resolution specification in these parameters that exceed the displayed maximum resolution, the display will black out with no indication to the user.

Example command:
Zyper$ set decoder Dec1 displayAdvancedTiming activeSize 1920 1080 fps 60 totalSize 2200 1200 syncFrontPorch 88 4 syncWidth 44 5 syncPolarity hPositive vPositive
**set decoder edidPreferMode**

Sets the preferred resolution from the display EDID

**Syntax**

```plaintext
set decoder id mode type
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

**mode**

Type: **STRING**

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edidPreferMode</td>
<td>Select preferred EDID mode</td>
</tr>
</tbody>
</table>

**type**

Type: **STRING**

HDCP options. (Note: Valid with ZyPerUHD only) Used to minimize connection time.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max</td>
<td>Default mode. Selects the largest resolution defined in the EDID.</td>
</tr>
<tr>
<td>strict</td>
<td>Selects the Preferred resolution as stated in the display EDID</td>
</tr>
</tbody>
</table>

“**max**” - Default mode. Selects the largest resolution defined in the EDID. This has been the operating mode prior to this command. In almost all cases, this is the native resolution of the display. However, some displays can accept a resolution above the native (and scale down). In this case, it is better to use the “**strict**” mode.

“**strict**” - The Preferred Resolution is selected as defined in the EDID 1.3 specification. EDID 1.3 specifies that the first Detailed Timing Descriptor in the Standard Timing Information block is always the preferred resolution, although it is only the native resolution if the native-resolution flag is set. If the native-resolution flag is not set, then the maximum resolution will be chosen (falls back to “**max**” mode).
Note: All comparisons of “resolution” actually mean comparisons of the associated Pixel Clock. The Pixel Clock represents the entire resolution definition: horizontal and vertical size, fps, bit-depth and color decimation (RGB/4:4:4, 4:2:2, 4:2:0).

The command will immediately reanalyze the active EDID and if needed change the preferred resolution and reconnect to the encoder.

The reason for the “max” mode, and for it being the default, is that many displays do not follow the EDID 1.3 specification, claiming a native, Preferred Resolution below the display’s actual native resolution. It is fairly common for a UHD display to have an HD resolution as the specified preferred resolution.

Note: ZyPer4K and ZyPerUHD, depending on mode, may support only a limited set of output resolutions, particularly when the scaler is enabled. ZMP will choose the active resolution based decoder capability, scaler mode and preferred resolution. However, the display’s Preferred Resolution is displayed regardless of what the decoder ultimate actually uses. The active resolution is displayed in the decoder status as well.

**Overriding Preferred Resolution Selection**

It should rarely be required. But if the EDID supplied by the display is not correct, or for some reason ZMP chooses a Preferred Resolution that is not desired, the following command will force the decoder to a specific output resolution:

```
set decoder <decoder> displayResolution activeSize <int> <int> fps <float>
```

When set, the decoder output resolution will remain as specified without exception.

Note: When in this mode, it is very possible that no video will be displayed, and with no warning from ZMP. It is up to the user to ensure that the output settings are valid for the display.
Scaler Control

ZyPer4K “HDMI 2.0” and ZyPerUHD decoders have output scaling. Besides the obvious benefit of supporting HD-only displays with a UHD source, the other major benefit is faster switching times. With ZyPer4K, there is virtually no delay. With ZyPerUHD it is less than a one second.

However, there are some cases where disabling the scaler produces a better image. Of course, if the scaler is disabled and the source provides a resolution greater than the display’s ability, it will be black. To solve this problem, we have a new mode that disables the scaler, but only if the display can handle the source resolution.

The decoder display-resolution command now has an option called “source”.

```
set decoder <decoder> display-resolution source
```

When in “source” mode the scaler is disabled if the display can handle the received resolution. Otherwise it is automatically enabled (e.g. if the source is 480 and the Preferred Resolution is 1080 then the scaler is disabled, but if source is UHD and the Preferred Resolution is 1080, then the scaler is enabled).

The downside to this mode: switching time between non-scaled resolutions is about 3 seconds. Switching time between scaled and non-scaled resolutions is closer to 4s.

Active Output Resolution Selection

Selecting the correct output resolution for a decoder is, unfortunately, a fairly complicated endeavor. Clearly depends on the display (Preferred Resolution), but also on the decoder capability and the source resolution.

Remember: All comparisons of “resolution” actually mean comparisons of the associated Pixel Clock. The Pixel Clock represents the entire resolution definition: horizontal and vertical size, fps, bit-depth and color decimation (RGB/4:4:4, 4:2:2, 4:2:0).

Also, setting “edidPreferMode” only affects which Preferred Resolution is chosen. It does not affect when that Preferred Resolution is used (or if it is used). Although the chosen Preferred Resolution is always reported in the decoder status output (as is the chosen active output resolution).
ZyPer4K HDMI 1.4 Devices

No scaler, effectively always in “displayResolution source” mode. Source is always sent to output. If output can’t handle source, there will be no video.

Decoder Preferred Resolution is only status; it is never used to affect the decoder output resolution. Decoder “displayResolution” overrides are ignored.

ZyPer4K HDMI 2.0 Devices

Presently, the decoder active resolution is limited to a number of resolutions: 4096x2160, 3840x2160, 1080x1920 or 1280x720. The closest lower resolution is used.

There are a number of exceptions to the operation.
- Scaler always converts to 8bit 444/RGB. That means UHDp60 4:2:0 is converted to UHDp60 4:4:4. UHDp60 YUV 4:2:0 bit rate is lower than HDMI 1.4. But UHDp60 4:4:4 is not. In this case, the output FPS is divided by 2.
- If in genlockScaled, videoWall or window mode, decoder FPS must equal encoder FPS
  - Means 1080p60 scaling to UHD must be UHDp60, which won’t work if display is only UHDp30 capable.
  - If UHDp60 > decoder Preferred Resolution, then the output is left at 1080p60.
- If source is 1080i
  - Output must be input FPS * 2
  - If decoder resolution > 1080, it is set to 1080.

displayResolution = auto
When in this mode, the output resolution will always be the Preferred Resolution. There really is no reason not to use this mode with the Z4K Charlie and will produce the lowest switching times.

displayResolution = source
When in this mode, the output resolution will always be the encoder resolution, unless the source resolution greater than the encoder resolution (same case as displayResolution auto).

This mode may provide better video at or below the preferred resolution of the display. However, the switching time is somewhat slower (~3.3s).

displayResolution = sourceIgnoreEdid
Same operation as displayResolution = auto, but effectively using a manually entered Preferred Resolution. Generally only used if the EDID is incorrect.
ZyPerUHD

The ZyPerUHD scaler scales up fine (source resolution lower than display preferred). However, it can only scale down from UHD to 1080.

Even with this limitation, the vast majority of installations will be fine. The exception comes with PC-based resolutions. For example a case that will not work well:

- 1080-only display and source resolution of 1920x1200

For the cases where VESA/PC resolutions such as 1920x1200, 2560x1440 and 2560x1600 are needed, all displays must be at least that resolution or greater. For example, a 1920x1200 display can handle all resolutions up to 1920x1200 and it can also handle UHD, since the decoder will output UHD scaled down to 1080 (which is fine for a 1920x1200 display).

And, clearly, all of those resolutions will be fine if the displays are UHD capable (scaling up works, plus, the new mode “display-size source” can be used).

If a configuration that causes downscaling that is not handled well, likely generating poor video, a warning will be generated.

**displayResolution = auto**

When in this mode, the output resolution will always be the **Preferred Resolution**, unless the source resolution greater than the preferred resolution.

This mode provides the fastest switching time (less than 1 second). However, there may be some cases where video quality is less than when using display-resolution = source.

If source is greater than decoder Preferred Resolution, then decoder output will be **1920x1080** (unless the display does not support it) with the preferred FPS. As noted, the only case this normally works for is when the source is 3840x2160.

**displayResolution = source**

When in this mode, the output resolution will always be the **encoder resolution**, unless the source resolution greater than the encoder resolution (same case as displaySize auto).

This mode may provide better video at or below the preferred resolution of the display. However, the switching time is somewhat slower (~3.3s).

**displayResolution = sourceIgnoreEdid**

Same operation as displayResolution = auto, but effectively using a manually entered Preferred Resolution. Generally only used if the EDID is incorrect.
set decoder powerSave

Enables or disables power save feature of the decoder. (ZyPerUHD only)

When decoder is not receiving a stream the decoder will enter a low power mode and the display will go black.

Syntax

set decoder id powerSave arg

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the decoder. String names are case-sensitive.

arg

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Power save feature enabled.</td>
</tr>
<tr>
<td>disabled</td>
<td>Power save feature disabled.</td>
</tr>
</tbody>
</table>

Example

set decoder myDecoder powerSave enabled
Success
set device ethernetManagementPort

Enables or disables the 1Gb Utility Ethernet port on the specified encoder or decoder.  
(ZyPer4K only)

Syntax

set device id ethernetManagementPort arg

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the device. String names are case-sensitive.

arg

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Ethernet port is enabled.</td>
</tr>
<tr>
<td>disabled</td>
<td>Ethernet port is disabled.</td>
</tr>
</tbody>
</table>

Example

set device myDecoder5 ethernetManagementPort disabled

Success

Related Commands

set device general name

set device rs232
set device sourceDisplay iconImageName
set device sourceDisplay location
set device sourceDisplay manufacturer
set device sourceDisplay model
set device sourceDisplay serialNumber
**set device general name**

Sets the name for the specified encoder or decoder.

**Syntax**

```plaintext
set device id general name str
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>id</code></td>
<td><strong>STRING or MAC Address</strong></td>
</tr>
<tr>
<td><code>str</code></td>
<td><strong>STRING</strong></td>
</tr>
</tbody>
</table>

`id`  
The name or MAC address of the device. String names are case-sensitive.

`str`  
The name for the device.

**Example**

```plaintext
set device myDecoder5 general name Samsung-55
Success
```

**Related Commands**

- set device ip
- set device ip static
- set device rs232
- set device sourceDisplay iconImageName
- set device sourceDisplay location
- set device sourceDisplay manufacturer
- set device sourceDisplay model
- set device sourceDisplay serialNumber
**set device ip**

Sets DHCP mode for the specified device.

**Syntax**

```
set device id ip arg
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

**arg**

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp</td>
<td>IP address assigned by DHCP server</td>
</tr>
<tr>
<td>linkLocal</td>
<td>IP address self assigned Link-Local</td>
</tr>
</tbody>
</table>

**Example**

```
set device ABC ip dhcp
Success
```

**Related Commands**

```
set device general name
set device ip static
set device rs232
set device sourceDisplay iconImageName
set device sourceDisplay location
set device sourceDisplay manufacturer
set device sourceDisplay model
set device sourceDisplay serialNumber
```
**set device ip static**

Sets static mode for the specified device. The IP address, subnet mask, and gateway must be supplied.

**Syntax**

```
set device id  ip static addr mask gatew
```

**Parameters**

- **id**
  - Type: **STRING or MAC Address**
  - The name or MAC address of the decoder. String names are case-sensitive.

- **addr**
  - Type: **IP Address**
  - The desired IP address for the device.

- **mask**
  - Type: **IP Address**
  - The desired subnet mask for the device.

- **gatew**
  - Type: **IP Address**
  - The desired gateway for the device.

**Example**

```
set device ABC ip static 10.5.68.121 255.255.255.0 10.5.64.1
Success
```
Related Commands

set device sourceDisplay manufacturer
set device sourceDisplay model
set device sourceDisplay serialNumber
**set device rs232**

Sets the RS232 settings for the specified device.

**Syntax**

```
set device id rs232 baud data stop parity
```

**Parameters**

**id**

*Type: STRING or MAC Address*

The name or MAC address of the device. String names are case-sensitive.

**baud**

*Type: INTEGER*

The baud rate for the device. Supply one of the following values from the table below.

<table>
<thead>
<tr>
<th>argument</th>
<th>2400</th>
<th>9600</th>
<th>19200</th>
</tr>
</thead>
<tbody>
<tr>
<td>2400</td>
<td>9600</td>
<td>19200</td>
<td></td>
</tr>
<tr>
<td>38400</td>
<td>57600</td>
<td>115200</td>
<td></td>
</tr>
</tbody>
</table>

**data**

*Type: INTEGER*

The data bit setting for the device. Supply one of the following values from the table below.

<table>
<thead>
<tr>
<th>argument</th>
<th>7-bits</th>
<th>8-bits</th>
</tr>
</thead>
<tbody>
<tr>
<td>7-bits</td>
<td></td>
<td></td>
</tr>
<tr>
<td>8-bits</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Commands

stop
Type: INTEGER

The stop bit setting for the device. Supply one of the following values from the table below.

<table>
<thead>
<tr>
<th>argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-stop</td>
</tr>
<tr>
<td>2-stop</td>
</tr>
</tbody>
</table>

parity
Type: STRING

The parity setting for the device. Supply one of the following values from the table below.

<table>
<thead>
<tr>
<th>argument</th>
</tr>
</thead>
<tbody>
<tr>
<td>even</td>
</tr>
<tr>
<td>odd</td>
</tr>
<tr>
<td>none</td>
</tr>
</tbody>
</table>

Example

set device decoderNumber2 rs232 57600 8-bits 1-stop none
Success

**set device sendIpMcastRange**

Sets allowable range of multicast addresses for selected devices. *(ZyPer4K only)*

**Syntax**

```
set device id sendIpMcastRange first:ip last:ip
```

**Parameters**

`id`

Type: **STRING or MAC Address**

The name or MAC address of the encoder. String names are case-sensitive. Can all use "all" or "encoders" as an ID option.

`first:ip / last:ip`

Type: **Multicast Address**

Supply the starting and ending multicast addresses in the allowable range.

Note: Allowable range is from 224.1.1.1 to 239.255.255.255

**Example**

```
set device encoders sendIpMcastRange 224.1.1.25 224.1.2.125
```

**set device sourceDisplay iconImageName**

Assigns an icon to the desired device. The icon will be displayed within the ZMP to identify the device.

**Syntax**

```plaintext
set device id sourceDisplay iconImageName fname
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The name or MAC address of the encoder or decoder. String names are case-sensitive.

**fname**

Type: **FILENAME**

The full filename of the icon to be used. The filename is case-sensitive.

**set device sourceDisplay location**

Assigns a location description for the specified device.

**Syntax**

```
set device id sourceDisplay location loc
```

**Parameters**

- **id**
  - Type: **STRING or MAC Address**
  - The name or MAC address of the device. String names are case-sensitive.

- **loc**
  - Type: **STRING**
  - The location description of the device (e.g. “Conference_Rm”, “Den”, etc.). Do not use quotes when specifying this string value.

**Example**

```
set device myDecoder3 sourceDisplay location VideoWall-1
Success
```

**set multiview**

Assigns source to a position and size within a multiview display. *(ZyPer4K only)*

**Syntax**

```plaintext
set multiview id windowNumber wn encoderName enc position percentPositionX posx percentPositionY posy percentSizeX sx percentSizeY sy layer ly
```

```plaintext
set multiview id windowNumber wn encoderName enc position pixelPositionX posx pixelPositionY posy pixelSizeX sx pixelSizeY sy layer ly
```

**Parameters**

**id**

Type: STRING

Name of previously created multiview. String names are case-sensitive.

**wn**

Type: Integer

Window number within the multiview (1-19)

**enc**

Type: STRING or MAC Address

The name or MAC address of the encoder. String names are case-sensitive.

**percentPositionX**

Type: Integer

X coordinate in percentage of multiview canvas. Upper left corner of window. (0-99)

**percentPositionY**

Type: Integer

Y coordinate in percentage of multiview canvas. Upper left corner of window. (0-99)

**pixelPositionX**

Type: Integer

X coordinate of multiview in multiview canvas. Upper left corner of window.

**pixelPositionY**

Type: Integer

Y coordinate of multiview in multiview canvas. Upper left corner of window.
pixelSizeX
  Type: Integer
  Size/Length of multiview window. Number of pixels in multiview canvas.

pixelSizeY
  Type: Integer
  Size/Height of multiview window. Number of Pixels in multiview canvas.

percentSizeX
  Type: Integer
  Size/Length of multiview window. As a percentage of X dimension of multiview canvas. (0-99)

percentSizeY
  Type: Integer
  Size/Height of multiview window. As a percentage of Y dimension of multiview canvas. (0-99)

ly
  Type: Integer
  Window Layer. Value from 1-9 with layer 1 being the bottom layer and 9 being the top.

Examples

Using Percentages
set multiview myMview1 windowNumber 1 encoderName myEnc1 percentPositionX 50 percentPositionY 50 percentSizeX 25 percentSizeY 25 layer 3

Using Pixel Values
set multiview myMview1 windowNumber 1 encoderName myEnc1 pixelPositionX 1920 pixelPositionY 1080 pixelSizeX 800 pixelSizeY 600 layer 3

Related Commands
create multiview

delete multiviewWindow
set multiview audioSource windowNumber
show multiviews config
show multiviews status
**set multiview (layer, position, size)**

Allows user to change a multiview window layer, position or size without specifying other parameters. *(ZyPer4K only)*

**Syntax**

```
set multiview id windowNumber wn positionX posx positionY posy sizeX sx sizeY sy layer ly
```

**Parameters**

- **id**
  - Type: **STRING**
  - Name of previously created multiview. String names are case-sensitive.

- **wn**
  - Type: **Integer**
  - Window number within the multiview (1-19)

- **percentPositionX**
  - Type: **Integer**
  - X coordinate in percentage of multiview canvas. Upper left corner of window. (0-99)

- **percentPositionY**
  - Type: **Integer**
  - Y coordinate in percentage of multiview canvas. Upper left corner of window. (0-99)

- **pixelPositionX**
  - Type: **Integer**
  - X coordinate of multiview in multiview canvas. Upper left corner of window.

- **pixelPositionY**
  - Type: **Integer**
  - Y coordinate of multiview in multiview canvas. Upper left corner of window.

- **pixelSizeX**
  - Type: **Integer**
  - Size/Length of multiview window. Number of pixels in multiview canvas.
**pixelSizeY**
  Type: **Integer**
  Size/Height of multiview window. Number of Pixels in multiview canvas.

**percentSizeX**
  Type: **Integer**
  Size/Length of multiview window. As a percentage of X dimension of multiview canvas. (0-99)

**percentSizeY**
  Type: **Integer**
  Size/Height of multiview window. As a percentage of Y dimension of multiview canvas. (0-99)

**ly**
  Type: **Integer**
  Window Layer. Value from 1-9 with layer 1 being the bottom layer and 9 being the top.

**Examples**

```plaintext
set multiview myMview1 windowNumber 2 layer 4
Success

set multiview myMview1 windowNumber 2 size percentSizeX 50 percentSizeY 50
Success

set multiview mv1 windowNumber 1 size pixelSizeX 500 pixelSizeY 400
Success
```

- show multiviews config
- show multiviews status
**set multiview audioSource windowNumber**

Selects the input source to provide Audio for multiview display. *(ZyPer4K only)*

**Syntax**

```
set multiview id audioSource windowNumber arg
```

**Parameters**

- **id**
  - Type: **STRING**
  - Name of previously created multiview. String names are case-sensitive.

- **arg**
  - Type: **STRING / Integer**
  - Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>Integer from 1-19 identifying source to use for audio</td>
</tr>
<tr>
<td>none</td>
<td>Set no audio for the multiview window</td>
</tr>
</tbody>
</table>

**Example**

```
set multiview myMview1 audioSource window number 4
Success
```

**Related Commands**

- `create multiview`
- `delete multiview`
- `delete multiviewWindow`
- `show multiviews config`
- `show multiviews status`
set multiview canvasSize

Selects the canvas size for creating multiview windows. (ZyPer4K only)

Helpful feature to control bandwidth of scaled streams for a multiview. Default canvas size is 3840x2160. This can create case where datarate from encoder is greater than 9.5Gb limit.(Full size stream plus scaled stream.) Reducing the canvas size will reduce required size and datarate of scaled stream used for multiview.

Syntax

set multiview id canvasSize pixelsHoriz pixelVert

Parameters

id
Type: STRING
Name of previously created multiview. String names are case-sensitive.

pixelsHoriz
Type: Integer
Horizontal width of the multiview canvas. (640 to 8192)

pixelsVert
Type: Integer
Vertical height of multiview window. (480 to 8192)

Note: Maximum canvas pixels is 8,847,360

Example

set multiview MyView1 canvasSize 1920 1080
Success

Related Commands

create multiview
delete multiview
delete multiviewWindow
show multiviews config
show multiviews status
**set multiview newEncoderName**

Assigns a new encoder to an existing multiview window. *(ZyPer4K only)*

**Syntax**

```
set multiview id windowNumber wn newEncoderName encName|none
```

**Parameters**

**id**

Type: *STRING*

Name of previously created multiview. String names are case-sensitive.

**wn**

Type: *Integer*

Window number within existing multiview. (1 to 19)

**encName**

Type: *STRING / STRING*

The name or MAC address of the encoder. String names are case sensitive. None is also an option to remove existing encoder and replace with nothing.

**Example**

```
set multiview mv2x2-Art windowNumber 3 newEncoderName ABC
Success

set multiview mv2x2-Art windowNumber 3 newEncoderName none
Success
```

**Related Commands**

- create multiview
- delete multiview
- delete multiviewWindow
- show multiviews config
- show multiviews status
set multiview title

Used to create a text overlay in a multiview window. (ZyPer4K only)

Create a string of text to be overlayed somewhere in a multiview window. Color of text and color of background can be specified. Size of text can be specified. Transparency of text and background can be specified. Note that 100% transparent setting is not fully transparent.

Syntax

```
set multiview id windowNumber wn title text title
set multiview id windowNumber wn title text-size ts
set multiview id windowNumber wn title transparency text tt background bt
set multiview id windowNumber wn title color text tc background bc
```

Parameters

```
id
Type: STRING
Name of previously created multiview. String names are case-sensitive.

wn
Type: Integer
Window number within the multiview (1-19)

ts
Type: Integer
Size of text (1-10)

tt
Type: Integer
Text Transparency. Percentage (0-100)

bt
Type: Integer
Background Transparency. Percentage (0-100)
```
tc

Type: STRING

Text color. Can be any of the following options: black, blue, brown, cyan, darkBlue, gray, green, lightBlue, lightGray, lime, magenta, maroon, olive, orange, purple, red, silver, white, yellow.

bc

Type: STRING

Background color. Can be any of the following options: black, blue, brown, cyan, darkBlue, gray, green, lightBlue, lightGray, lime, magenta, maroon, olive, orange, purple, red, silver, white, yellow.

title

Type: STRING

Any text string to be associated and displayed in the selected multiview window. Strings contains spaces must be enclosed in quotations.

Examples

set multiview MyView1 windowNumber 1 title text “Window #1”
Success

set multiview MyView1 windowNumber 1 title textSize 10
Success

set multiview MyView1 windowNumber 1 title transparency text 0 background 100
Success

set multiview MyView1 windowNumber 1 title color black background-color green

Related Commands

create multiview
delete multiview
delete multiviewWindow
show multiviews config
show multiviews status
set preset commands auto

Used to update an existing preset commands

Syntax

set preset id commands auto connections

Parameters

id

Type: STRING

The name of the preset. String names are case-sensitive.

connections

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>existingConnections</td>
<td>Uses the existing set of connections to create the command list</td>
</tr>
<tr>
<td>empty</td>
<td>Creates an empty set of commands. No connections</td>
</tr>
</tbody>
</table>

Example

set preset morning commands auto existingConnections
Success

set preset morning commands auto empty
Success

Related Commands

create preset
delete preset
run preset
show preset
set preset commands blob

Used to update an existing preset commands

Syntax

set preset id commands blob connections

Parameters

id
Type: STRING
The name of the preset. String names are case-sensitive.

connections
Type: STRING
Manually enter a list of commands contained within quotations. Insert a semicolon between commands. Maximum character limit is 4096.

Example

set preset morning commands blob “join Cuba Bot-Left fast-switched; join NBC Bot_Right fast-switched; join Sports Top-Right fast-switched; join Media Player Top_Left fast-switched”

Below is image from ZMP GUI showing these commands in the Preset window:

Commands:

<table>
<thead>
<tr>
<th>Join Cuba Bot-Left fast-switched</th>
</tr>
</thead>
<tbody>
<tr>
<td>Join NBC Bot_Right fast-switched</td>
</tr>
<tr>
<td>Join Sports Top-Right fast-switched</td>
</tr>
<tr>
<td>Join Media Player Top_Left fast-switched</td>
</tr>
</tbody>
</table>

Related Commands

create preset
delete preset
run preset
show preset
set preset description

Used to update an existing preset description

Syntax

```
set preset id description  
```

Parameters

```
id       Type: STRING
    The name of the preset. String names are case-sensitive.
description       Type: STRING
    Updated description of the preset
```

Example

```
set preset morning description "Open for business"
Success
```

Related Commands

- create preset
- delete preset
- run preset
- show preset
**set preset schedule eventColor**

Used to update an existing preset schedule color in the calendar.

**Syntax**

```
set preset id schedule scname eventColor color
```

**Parameters**

- **id**
  
  Type: **STRING**
  
  The name of the preset. String names are case-sensitive.

- **scname**
  
  Type: **STRING**
  
  Name of the schedule.

- **color**
  
  Type: **STRING**
  
  Name of the new color. Options include the following: aqua, aquamarine, black, blue, brown, coral, cyan, darkBlue, darkSlateGray, deepPink, deepSkyBlue, fuchsia, gray, green, hotPink, khaki, lightBlue, lightGray, lightSeaGreen, lightSlateGray, lime, magenta, maroon, mistyRose, olive, orange, pink, purple, red, silver, teal, web-hex-color starting with # (e.g. #22ffee), white, yellow, zvGreen, zvPurple

**Example**

```
set preset morning schedule opentime zvGreen
Success
```

**Related Commands**

- create preset
- delete preset
- run preset
- show preset
**set preset schedule month**

Used to update an existing preset schedule month/day/time to run

**Syntax**

```
set preset id schedule scname month month dayOfMonth day dayOfWeek
day hour hour minute minute
```

**Parameters**

*id*

Type: **STRING**

The name of the preset. String names are case-sensitive.

*scname*

Type: **STRING**

Name of the schedule.

*month*

Type: **STRING**

Months to run this preset: Options are all, jan, feb, mar, apr, may, jun, jul, aug, oct, nov, dec

*dayOfMonth*

Type: **Integer**

Days of the month to run this preset. Enter an integer date or “all”

*dayOfWeek*

Type: **STRING**

Days of week to run this preset: Options are all, sunday, monday, tuesday, wednesday, thursday, friday, saturday, weekday, weekend. (Note: Weekday = M-F, Weekend = Sat+Sun)

*hour*

Type: **Integer**

Hour to run this preset. Enter an integer time (24 hour format) or “all”
minute

Type: Integer

Enter the minute (0-59) for this preset to run.

Example

set preset test1 schedule LateLunch month all dayOfMonth all dayOfWeek weekday hour 14 minute 30
Success

Related Commands

create preset
delete preset
run preset
show preset
**set responses rs232TermChars**

Specifies the termination character for an RS232 string. The default string is “\n\r”. Any character in the termination string causes the response-string to terminate and be placed into the response-string ring buffer.

This string is optional. If it is not specified, then the string is empty and each low-level response is handled as a separate response.

**Syntax**

```
set responses id chr
```

**Parameters**

*id*

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

*chr*

Type: **STRING**

The specified string.

**Example**

```
set responses decoder2 rs232TermChars "\r"
Success
```

**Related Commands**

```
set device rs232
```
set server api lineWrap

Sets the number of characters the API will display in the Command Line Interface before wrapping to a new line.

Syntax

```
set server api lineWrap wrap
```

Parameters

```
wrap
```

Type: INTEGER

Integer value from 100 to 512

Example

```
set server api lineWrap 200
Success
```
**set server autoEdidMode**

Sets the EDID mode for the Management Platform. By default, Auto-EDID mode is enabled.

**Syntax**

```
set server autoEdidMode mode
```

**Parameters**

`mode`

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disabled</td>
<td>Disables auto-EDID mode.</td>
</tr>
<tr>
<td>enabled</td>
<td>Enables auto-EDID mode.</td>
</tr>
</tbody>
</table>

**Example**

```
set server autoEdidMode disabled
Success
```

**Related Commands**

```
set server timezone
```
**set server dataTunnelMode**

Sets the transfer mode for the Management Platform.

**Syntax**

```
set server dataTunnelMode mode
```

**Parameters**

**mode**  
Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>raw</td>
<td>Sets raw communication mode.</td>
</tr>
<tr>
<td>telnet</td>
<td>Sets telnet communication mode.</td>
</tr>
</tbody>
</table>

**Example**

```
set server dataTransferMode telnet
Success
```

**Related Commands**

```
set server timezone
```
set server date

Used to set server date manually or via ntp server. Note: NTP Server must be IPV4

Syntax

set server date mode

set server date ntpServer address <domainName>

set server date manual month <int> day <int> year <int> hour <int> minute <int>

Parameters

mode

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>manual</td>
<td>Sets date/time manually</td>
</tr>
<tr>
<td>ntpServer</td>
<td>Sets date/time via ntp server. Must provide valid IP address for an ntp Server.</td>
</tr>
</tbody>
</table>

Example

set server date manual month 4 day 1 year 2021 hour 15 minute 1
Success

set server date ntpServer address 129.6.15.28
Success

https://tf.nist.gov/tf-cgi/servers.cgi

Related Commands

set server timezone
show server config
show server info
set server encoderDefault audio

Sets the default encoder audio format for HDMI audio input.

Detailed Background

ZeeVee added a feature that will allow compressed formats to be passed down in an encoder EDID file. This EDID will be then forwarded to the source device to determine the type of audio sent to the encoder.

This enhancement was to provide fastSwitched connections the “compressed audio” options in the EDID file. Prior to this version with the fast-switched connection, ZeeVee modified the EDID passed from the decoder to the encoder and removed all compression formats. This left just LPCM as the only option under the “Audio data block” in the edid file.

>>> Audio data block <<<
  Linear PCM, max channels 8
  Supported sample rates (kHz): 192 176.4 96 88.2 48 44.1 32
  Supported sample sizes (bits): 24 20 16

The information provided to the Video Source device (such as BluRay Player or Media player) increases the possibility of compression being a chosen audio format. However it is still up to the device to choose uncompressed or compressed formats. It is important to know that some devices such as the Apple 4K TV requires the audio output type to be set (even if the audio format is available in the EDID). Compression will need to be set manually on these types of devices.

In addition any downmixed stream internal to ZyPer devices will not process compressed audio, so you will not hear compressed audio on these connections.

Syntax

set server encoderDefault edid audio mode

Parameters

mode

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allowCompressed</td>
<td>Passes the decoders edid with unmodified audio information and thus allows compression options to be seen.</td>
</tr>
<tr>
<td>onlyPcm</td>
<td>Forces the EDID modification described above</td>
</tr>
</tbody>
</table>
Example

set server encoderDefault edid audio allowCompressed
Success

Related Commands

set encoder edid audio

Additional Information

In an attempt to properly identify the Audio Streams used under the product, the following changes were also made along with some modification to the API commands.

<table>
<thead>
<tr>
<th>Product</th>
<th>Old Audio Stream Name</th>
<th>New Stream Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZyPer4K</td>
<td>hdmi (used in genlocked mode)</td>
<td>hdmiPassthroughAudio</td>
</tr>
<tr>
<td>ZyPer4K</td>
<td>hdmi-audio-downmix</td>
<td>hdmiAudio</td>
</tr>
<tr>
<td>ZyPer4K</td>
<td>analog-audio</td>
<td>analogAudio</td>
</tr>
<tr>
<td>ZyPerUHD</td>
<td>audio</td>
<td>hdmiAudio</td>
</tr>
<tr>
<td>ZyPerUHD</td>
<td>analog-audio</td>
<td>analogAudio</td>
</tr>
<tr>
<td>ZyPerHD</td>
<td>Part of fast-switched connection</td>
<td>No Change</td>
</tr>
<tr>
<td>ZyPerHD</td>
<td>Part of fast-switched connection</td>
<td>No Change</td>
</tr>
</tbody>
</table>
set server ip

Sets the IP Address of the Management Platform. For MP hardware with multiple Network Interfaces this command is used to set the IP Address of each interface independently.

Syntax

set server ip id mode IP Address Mask Gateway reboot

Parameters

id

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>Select the “Video” network. (ZyPer Network)</td>
</tr>
<tr>
<td>management</td>
<td>Select the “Management” network. (Non-ZyPer Network)</td>
</tr>
</tbody>
</table>

mode

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>Manually select/assign IP Address</td>
</tr>
<tr>
<td>dhcp</td>
<td>Allow DHCP server to automatically assign IP Address</td>
</tr>
</tbody>
</table>

Example

set server ip server dhcp reboot
Success

set server ip server static 192.168.1.26 255.255.255.0 none reboot
Success

set server ip management static 192.168.4.20 255.255.255.0 192.168.4.1 reboot
Success

Related Commands

set server timezone
set server isaac address

Sets the domain name of the isaac server.

Syntax

set server isaac address domainname

Parameters

domainname
  Type: STRING
  domainname of the Isaac server

Example

set server isaac address
Success

Related Commands

set server isaac subsystemId
**set server isaac subsystemId**

Sets the subsystemID on isaac server.

**Syntax**

```
set server isaac address subsystemId
```

**Parameters**

**subsystemID**

*Type: STRING*

Subsystem ID of the Isaac server

**Example**

```
set server isaac subsystemId Wallyworld
Success
```

**Related Commands**

```
set server isaac address
```
set server license

Sets the license for the Management Platform. This controls the maximum number of endpoints supported by the Management Platform

Syntax

set server license key

Parameters

key
Type: STRING

License key obtained from ZeeVee that sets maximum number of endpoints

Example

set server license QDZV-AYYA-0048-303D-5C0E-BD5D-56AA-154D-976C-BCE3-BAC4
Success

Related Commands

set server autoEdidMode
set server redundancy

Sets a virtual IP address and Mask for the Master and Slave Management Platforms in the system. (See Appendix for additional Redundancy Configuration Instructions)

Syntax

set server redundancy serv_id virtualIP address IP_Address
networkInterface video|management

Parameters

serv_id
  Type: STRING
  The servers to apply Virtual-ID to.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allServers</td>
<td>All Management Platforms on the Network. (Master and Slave)</td>
</tr>
<tr>
<td>thisServer</td>
<td>The specific server (Master or Slave) currently logged into.</td>
</tr>
<tr>
<td>server IP Address</td>
<td>Manually enter IP address of a specific Management Platform. (Master or Slave)</td>
</tr>
</tbody>
</table>

IP_Address and Mask
  Type: STRING

Virtual IP address with Subnet Mask

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Virtual IP address to use for designated servers: Example: 192.168.0.25</td>
</tr>
<tr>
<td>networkInterface</td>
<td>Selects either the Video or Management interface for MP units with Dual Network Interfaces</td>
</tr>
</tbody>
</table>

Note: The virtual address has to be accessible within the subnet already defined for the interface. So, if the "video network", aka the original interface has 172.6.2.22/24, then the virtual address has to be 172.16.2.xxx.
Examples

set server redundancy allServers virtualIp address 192.168.0.25
networkInterface video
Success

set server redundancy thisServer preferredMaster true
preferredSlave false
Success

set server redundancy 192.168.1.202 preferredMaster false
preferredSlave true
Success
set server ssh password

Sets the password for ssh access.

The ssh account is: zyper
The default password is: zyper

If a password is not provided, then the current password will be deleted. In this case, no password prompt will be displayed.

Syntax

```
set server ssh password pass
```

Parameters

```
pass
```
Type: STRING

The desired password. (String with length from 4 to 64 characters)

Examples

```
set server ssh password biGB055
Success

ssh zyper@<ip_address>
```

Notes

To reset system to no ssh password:
FTP the empty file named “defaultPasswords” to the /files directory of the MP (no file extension)
Power cycle the MP within 1 minute, when it comes back the passwords will be defaulted.

This provides the very secure requirement of having physical access to the MP in order to reset the password.

Related Commands

```
set server autoEdidMode
set server telnet password
set server telnet mode
set server timezone
```
set server telnet password

Sets the password for Telnet. If a password is not provided, then the current password will be deleted. In this case, no password prompt will be displayed.

By default Telnet has no password.

Syntax

set server telnet pass

Parameters

pass  Type: STRING

The desired password.

Example

set server telnet password biGB055
Success

Notes

To reset system to no telnet password:
FTP the empty file named “defaultPasswords” to the /files directory of the MP (no file extension)
Power cycle the MP within 1 minute, when it comes back the passwords will be defaulted.

This provides the very secure requirement of having physical access to the MP in order to reset the password.

Related Commands

set server autoEdidMode
set server ssh password
set server telnet mode
set server timezone
**set server telnet mode**

Used to enable or disable telnet access to the server.

**Syntax**

```
set server telnet mode mode
```

**Parameters**

*mode*

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Telnet access is enabled</td>
</tr>
<tr>
<td>disabled</td>
<td>Telnet access is disabled</td>
</tr>
</tbody>
</table>

**Example**

```
set server telnet mode disabled
Success
```

**Example trying to access via Telnet once disabled**

```
telnet 192.168.0.78
Trying 192.168.0.78...
telnet: connect to address 192.168.0.78: Connection refused
telnet: Unable to connect to remote host
```

**Related Commands**

- `set server autoEdidMode`
- `set server ssh password`
- `set server telnet password`
- `set server timezone`
**set server timezone**

Sets the time zone for the Management Platform. The time zone must be specified in POSIX format.

**Syntax**

```
set server timezone zone
```

**Parameters**

`zone`

Type: **STRING**

The time zone in POSIX format.

**Example**

```
set server timezone America/New_York
Success
```

**Link to list of POSIX format timezones:**

**Related Commands**

- `set server autoEdidMode`
- `set server date ntpServer address <domainName>`
- `set server date manual month <int> day <int> year <int> hour <int> minute <int>`
- `show server info`
- `show server config`
**set videoWall size**

Changes the size of the specified video wall and bezel parameters. Bezel values are measured in pixels.

*Setting bezel values will affect a resolution change to the display. If the resolution is not supported by the display, then the display will have no picture. If this is the case, try assigning a different bezel pixel value.*

**Syntax**

```
set videoWall id size rows cols topBezel bezt bottomBezel bezb leftBezel bezl rightBezel bezr
```

**Parameters**

- **id**
  
  Type: _STRING_
  
  The name of the video wall. String names are case-sensitive.

- **rows**
  
  Type: _INTEGER_
  
  The number of rows. (Maximum 15 for ZyPer4K, Maximum 9 for ZyPerUHD, Maximum 4 for ZyPerHD)

- **cols**
  
  Type: _INTEGER_
  
  The number of columns. (Max 15 for ZyPer4K, Max 9 for ZyPerUHD, Max 4 for ZyPerHD)

- **bezt**
  
  Type: _INTEGER_
  
  The top bezel pixel value.

- **bezb**
  
  Type: _INTEGER_
  
  The bottom bezel pixel value.

- **bezl**
  
  Type: _INTEGER_
  
  The left bezel pixel value.
**bezr**

Type: **INTEGER**

The right bezel pixel value.

**Note:** Bezel adjustment only supported on **ZyPer4K**

**Example**

```
set videoWall Mywall1 size rows 5 columns 5 topBezel 0 bottomBezel 0 leftBezel 0 rightBezel 0
Success
```

**Related Commands**

- create videoWall
- set videoWall
- show videoWalls
- join videoWall
- set videoWall newName
**set videoWall decoder**

Assigns the specified decoder, to the desired row and column, on the specified video wall.

**Syntax**

```
set videoWall wallid decoder id row col
```

**Parameters**

**id**

Type: STRING or MAC Address

The name or MAC address of the decoder. String names are case-sensitive. If none is passed as the argument, then any existing display is disconnected from that position in the video wall.

**wallid**

Type: STRING

The name of the video wall. String names are case-sensitive.

**row**

Type: INTEGER

The row of the specified video wall.

**col**

Type: INTEGER

The column of the specified video wall.

**Example**

```
set videoWall myVideoWall decoder myDecoder 2 3
Success
```

**Related Commands**

- create videoWall
- set videoWall
- show videoWalls
- join videoWall
**set videoWall newName**

Changes the name of an existing video wall

**Syntax**

```
set videoWall id newName name
```

**Parameters**

*id*

**Type:** STRING or MAC Address

The name or MAC address of the encoder. String names are case-sensitive. If `none` is passed as the argument, then the display is disconnected from that position in the video wall.

*name*

**Type:** STRING

The updated name of the video wall.

**Example**

```
set videoWall myWall2 newName yourWall2
Success
```

**Related Commands**

- `create videoWall`
- `set videoWall`
- `show videoWalls`
- `join videoWall`
**show dataTunnels**

Shows what rs232 or IR data relay ports are opened on the server.

The feature of data-relays was added to allow a third party to connect to the ZMP server with a specific port and pass raw or telnet API commands (depending on the mode) to the server and port which is designated for a particular encoder or decoder.

**Syntax**

```
show dataTunnels
```

**Parameters**

*none*

**Example**

```
show dataTunnels
dataSessions(d8:80:39:9a:96:7);
  device: name=Cuba
  irTunnel: port=1234
  irTunnel-connections: none
Success
```

**Related Commands**

- `dataConnect`
- `set server dataTunnelMode`
show device capabilities

Displays device capabilities for the specified device(s).

Syntax

show device capabilities id select [since]

Parameters

id

Type: STRING or MAC Address

The identifier of the device. Either the full or portion of a string name or MAC address can be supplied.

select

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays configuration information for all available devices.</td>
</tr>
<tr>
<td>encoders</td>
<td>Only encoders are displayed.</td>
</tr>
<tr>
<td>decoders</td>
<td>Only decoders are displayed.</td>
</tr>
</tbody>
</table>

since

This parameter is optional and can be specified to display units based on the number of changes, using the lastChangeId value on each device. However, if used, a lastChangeId value must follow. Supply the since argument before the providing the lastChangeId value.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>since</td>
<td>Required when using this parameter.</td>
</tr>
</tbody>
</table>
Example

```plaintext
show device capabilities MyEncl since 20
device(d8:80:39:eb:1:cb);
  device.gen; lastChangeId=28
  device.CapabilitiesVersion; values=1
  device.analogAudioPort; values=none:hdmiAudioDownmix
  device.colorDepth; values=fastSwitchDeepColor:multiviewDeepColor
  device.colorEncoding; values=fastSwitchSubsample:multiviewSubsample
  device.edid; values=save:load
  device.edidAudioFormat; values=onlyPcm:allowCompressed:serverDefault
  device.ethernetManagementPortMode; values=enabled:disabled
  device.factoryDefaults; values=supported
  device.firmwareUpdate; values=...apz

Related Commands

- `show device status`
- `show device config`
**show device config**

Displays device information for the specified device(s).

**Syntax**

`show device config id select [since]`

**Parameters**

**id**

Type: **STRING or MAC Address**

The identifier of the device. Either the full or portion of a string name or MAC address can be supplied. Can also enter in one of the arguments below.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays configuration information for all available devices.</td>
</tr>
<tr>
<td>commands</td>
<td>Shows all the command used to configure every device, multiview, video wall in the system</td>
</tr>
<tr>
<td>encoders</td>
<td>Only encoders are displayed.</td>
</tr>
<tr>
<td>decoders</td>
<td>Only decoders are displayed.</td>
</tr>
</tbody>
</table>

**since**

This parameter is optional and can be specified to display units based on the number of changes, using the `lastChangeId` value on each device. However, if used, a lastChangeId value must follow. Supply the `since` argument before the providing the `lastChangeId` value.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>since</td>
<td>Required when using this parameter.</td>
</tr>
</tbody>
</table>
Example

show device config Curved
device(d8:80:39:9a:e6:d);
  device.gen; model=Zyper4K, type=encoder, name=Curved, state=Up,
  lastChangeId=124
  device.gen; firmware=4.0.1.0
  device.gen; ethernetManagementPortMode=disabled
device.hdmi; hdcpMode=enabled
device.ports; videoPort=hdmi
device.ip; mode=dhcp, address=172.16.6.33, mask=255.255.255.0,
gateway=172.16.6.1
  device.rs232; sendingToMacOrIp=Top_Right(172.16.6.42),
terminationChars=\x0A\x0D, baudrate=57600, dataBit=8, stop_Bit=1,
  parity=none
  device.ir; sendingToMacOrIp=Bot_Right(172.16.6.71)
device.source; iconImageName=foxSports, manufacturer=none,
  model=none, location=none, serialNumber=none
  device.audioOutSourceType; analogOutSourceType=none
  device.edid; loadMode=auto, audio=serverDefault
device.sendIpMcastRange; first=224.1.1.1, last=239.255.255.255
device.videoStream; ipMcastAddr=224.1.1.14, mode=enabled
device.videoScaledStream; ipMcastAddr=224.1.1.1, mode=disabled,
  sizeX=0, sizeY=0
  device.analogAudioStream; ipMcastAddr=0.0.0.0, mode=disabled
  device.hdmiAudioStream; ipMcastAddr=224.1.1.16, mode=enabled
  device.previewStream; mode=disabled
  lastChangeIdMax(125);
Success

Related Commands

show device status
show device capabilities
show device connections
**show device connections**

Shows encoder connections to decoders

**Syntax**

`show device connections`

**Parameters**

`none`

**Example**

```
show device connections
encoder.GalapogosHD; BotLeftHD
encoder.RaptorsHD; SamsungHD
encoder.MuralsHD; BotRightHD
encoder.Soccer4K; TopRight, BotLeft
Success
```

**Related Commands**

- `show device status`
- `show device capabilities`
- `show device config`
show device status

Displays status information for the specified device(s). This command functions the same as the `show device config` command.

Syntax

```
show device status id [since]
```

Parameters

id

Type: **STRING or MAC Address**

The identifier of the device. Either the full or portion of a string name or MAC address can be supplied.

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays configuration information for all available devices.</td>
</tr>
<tr>
<td>encoders</td>
<td>Only encoders are displayed.</td>
</tr>
<tr>
<td>decoders</td>
<td>Only decoders are displayed.</td>
</tr>
</tbody>
</table>

since

This parameter is optional and can be specified to display units based on the number of changes. Supply this argument followed by the desired value to query.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>since</td>
<td>Required when using this parameter.</td>
</tr>
</tbody>
</table>
Example

```plaintext
show device status Cuba
device(d8:80:39:9a:96:7);

set preset
**show responses**

Displays response strings from the specified device.

**Syntax**

```
show responses id type param3
```

**Parameters**

- **id**
  
  **Type:** STRING or MAC Address
  
  The name or MAC address of the device. String names are case-sensitive.

- **type**
  
  **Type:** STRING
  
  Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ir</td>
<td>Displays IR response strings.</td>
</tr>
<tr>
<td>rs232</td>
<td>Displays RS232 response strings.</td>
</tr>
</tbody>
</table>

- **param3**
  
  Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>last</td>
<td>Displays the last received response, based on the argument supplied for the type parameter.</td>
</tr>
<tr>
<td>lastChangeId</td>
<td>Displays the <code>lastChangeId</code> of the most recently received response.</td>
</tr>
<tr>
<td>since</td>
<td>Displays only new response data. Follow this argument with desired value to query.</td>
</tr>
</tbody>
</table>
Example

```
show responses 0:1e:c0:f6:b0:8a rs232 since 10
lastChangeId(0);
Success

show responses 0:1e:c0:f6:b0:8a ir lastChangeId
lastChangeId(0);
Success

show responses 0:1e:c0:f6:b0:8a ir last
lastChangeId(0);
Success

show responses UHDdec1 rs232 last
device(34:1b:22:80:64:68);
  device.rs232Response.19; string="Yes ZeeVee Support is the
  Greatest\x0D"
lastChangeId(20);
Success

Zyper$ show responses UHDdec1 rs232 since 19
device(34:1b:22:80:64:68);
  device.rs232Response.19; string="Yes ZeeVee Support is the
  Greatest\x0D"
  device.rs232Response.20; string="Really, still the greatest!\x0D"
lastChangeId(21);
Success
```
**show server config**

Displays configuration information for the Management Platform.

**Syntax**

```
show server config
```

**Parameters**

`none`

**Example**

```
show server config
server(172.16.6.111);
  server.ipServerAddress; mode=dhcp, address=172.16.6.111
  server.ipManagementAddress; mode=none, address=NA
  server.telnetAccess; mode=enabled
  server.encoderDefault.edid; audio=allowCompressed
  server.dataTunnelMode; telnet=telnet
  server.logging; level=1
Success
```

**Related Commands**

`show server info`
show server info

Displays information for the Management Platform, including IP settings, uptime, and license level.

Syntax

show server info

Parameters

none

Example

show server info
server(172.16.6.111);
server.gen; hostname=zyper.local, version=2.1.1.36527,
previousVersion=2.1.1.36517, macAddress=94:c6:91:a2:7a:fc,
serialNumber=ZZM1K400007D
server.gen; uptime=4d:2h:4m:42s, freeMem= 6.79GB, bootCount=37
server.gen; runningInVm=false
server.time; time=Mon Jan 11 11:08:59 2021, timezone=America/New_York
server.license; productID=354CAA85-E826-41BC-6878-94C691A27AFC,
license=none
server.license; limit=24, knownDevices=14, devicesUp=11,
devicesExceeded=0
server.deviceUpdates; active=0
server.activeDeviceVersions; num_0.10.2.0=2, num_2.11.3.0=1,
num_4.0.1.0=8
Success

Related Commands

show server config
revert server
show server redundancy

Displays information about master and slave Management Platforms

Syntax

show server redundancy

Parameters

none

Example

show server redundancy
server(172.16.6.111);
   server.status; state=master, version=2.1.1.36527, wasMaster=true, wasSlave=true
   server.config; preferredMaster=true, preferredSlave=true
   server.virtualIp; address=0.0.0.0, networkInterface=video
Success

Related Commands

set server redundancy
redundancy switchover
**show snmp**

Displays information related to SNMP. *(Please see Section 5 of this manual for additional details on SNMP support)*

**Syntax**

```
show snmp arg
```

**Parameters**

**type**

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trapServers</td>
<td>Displays snmp trap servers.</td>
</tr>
<tr>
<td>users</td>
<td>Displays snmp users.</td>
</tr>
</tbody>
</table>

**Example**

```
show snmp trapServers
snmp(172.16.6.111);
Success

show snmp users
snmp(172.16.6.111);
Success
```

**Related Commands**

```
add snmp
delete snmp
```
show values

Shows all possible information/values associated with encoders, decoders, servers or multiviews.

Syntax

show values arg

Parameters

arg

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays all values encoders, decoders, servers and multiviews. (Status, Config, Info, Redundancy)</td>

device.usb.downlinks; values=[none] | [mac=<decMac1>|link_1, name=<decName1>|existsButUnknown], [mac=<decMacN>|link_N, name=<decName N>|existsButUnknown]
device.usb.filter; values=none|exceptHid|storage
device.videoStream.mode; values=enabled|disabeld
device.videoScaledStream.mode; values=enabled|disabeld
Success
show videoWalls

Displays all video walls that have been created and all associated information.

Syntax

show videoWalls

Parameters

none

Example

show videoWalls
videoWall(wall1);
   videoWall.gen; videoSourceMac=none, numDisplayRows=2, numDisplayCols=2
   videoWall.bezel; top=0, bottom=0, left=0, right=0
   videoWall.decodersRow1; col1=Top_Left, col2=Top-Right
   videoWall.decodersRow2; col1=Bot-Left, col2=Bot_Right
Success

Related Commands

create videoWall
set videoWall
**show zones**

Displays all zones that have been created and all associated information.

**Syntax**

```
show zones
```

**Parameters**

`none`

**Example**

```
show zones
  1stfloor; Top-Right, Top_Left
  1stfloor.1stfloorroom2; empty
Success
```

**Related Commands**

- `add zoneDisplay`
- `create zone`
- `delete zone`
- `delete zoneDisplay`
**shutdown server**

Performs a shutdown of the Management Platform.

**Syntax**

```
shutdown server
```

**Parameters**

```
one
```

**Example**

```
shutdown server
Success
Connection closed by foreign host.
```

**Related Commands**

```
restart server
```
**sleep**

Specifies a sleep duration in milliseconds. This command is sometime required when executing a series of commands within a web page, using AJAX. Often times, a pause must occur in order for a device or the Management Platform to change states before another command is executed.

**Syntax**

```plaintext
sleep ms
```

**Parameters**

- `ms`  
  Type: **INTEGER**
  
  The duration in milliseconds.

**Example**

```plaintext
sleep 500
Success
```

**Related Commands**

- `script`
**start encoder**

Used to start a specific encoder multicast stream. This command only has affect if at least one decoder has been "joined" to the encoder and the "encoder stop" command has been used to override the enabling of the encoder stream. In effect, this command removes a previously entered "encoder stop" command – it returns stream control to normal operation based on existing "join" configuration. The command will immediately restore stream operation based on existing join configuration. No further join commands are required. *(ZyPer4K only)*

**Syntax**

```
start encoder id stream arg
```

**Parameters**

- **id**
  - Type: **STRING or MAC Address**
  - The identifier of the device. Either the full or portion of a string name or MAC address can be supplied.

- **arg**
  - Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analogAudio</td>
<td>analog audio multicast stream.</td>
</tr>
<tr>
<td>hdmiAudio</td>
<td>downmix audio multicast stream</td>
</tr>
<tr>
<td>video</td>
<td>full scale video stream</td>
</tr>
<tr>
<td>videoScaled</td>
<td>downscaled video stream (for multiview)</td>
</tr>
</tbody>
</table>

**Example**

```
start encoder Myencoder1 stream video
Success
```

**Related Commands**

```
stop encoder
```
**stop encoder**

Used to stop a specific encoder multicast stream. This command only has affect if at least one decoder has been "joined" to the encoder. In effect, this command overrides any existing "join" command – either present or future. *(ZyPer4K only)*

When stopping a “scaled-video” stream, any multiview window receiving that stream will go black. The rest of the multiview will be unaffected.

**Syntax**

```
stop encoder id stream arg
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The identifier of the device. Either the full or portion of a string name or MAC address can be supplied.

**arg**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analogAudio</td>
<td>analog audio multicast stream.</td>
</tr>
<tr>
<td>hdmiAudio</td>
<td>downmix audio multicast stream</td>
</tr>
<tr>
<td>video</td>
<td>full scale video stream</td>
</tr>
<tr>
<td>videoScaled</td>
<td>downscaled video stream (for multiview)</td>
</tr>
</tbody>
</table>

**Example**

```
stop encoder Myencoder1 stream videoScaled
Success
```

**Related Commands**

start encoder
**switch**

This command is used in conjunction with the IR and RS232 switching commands. Both the rs232 and the ir argument specify unidirectional connection between two devices. When switching data to the server, use the `show responses` command to retrieve the data.

**Syntax**

```
switch txid rxid type
```

**Parameters**

**txid**

Type: **STRING or MAC Address**

The name or MAC address of the encoder. String names are case-sensitive.

**rxid**

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

**type**

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ir</td>
<td>Specifies a IR connection. <em>(ZyPer4K and ZyPerUHD only)</em></td>
</tr>
<tr>
<td>rs232</td>
<td>Connection to another device or the server. Set <code>rxid = none</code> to pass data to an arbitrary IP host.</td>
</tr>
</tbody>
</table>

**Example**

```
switch Wildlife SonyXBR4 rs232
Success
```

**Related Commands**

`send`
**troubleReport**

Generates capture logs and system state information and is used by the ZeeVee support team for troubleshooting purposes. This file is in .tgz format and is written to the /srv/ftp/files folder on the Management Platform.

**Syntax**

```
troubleReport
```

**Parameters**

*none*

**Example**

```
troubleReport
Creating Trouble Report
Saving device status and configuration...
Saving SQL database...
Saving system files...
Saving rcServerMain binary file...
Saving device EDIDs...
Saving device specific information; this may take a few seconds...
Success
```
**update device**

Updates the firmware on the encoder and/or decoder units. The firmware update file uses the `.apz` or `.zip` extension.

**Syntax**

```
update device arg file
```

**Parameters**

`arg`

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Encoder or Decoder name. Names are case-sensitive</td>
</tr>
<tr>
<td>all</td>
<td>All encoders and decoders in the system</td>
</tr>
<tr>
<td>encoders</td>
<td>All encoders in the system</td>
</tr>
<tr>
<td>decoders</td>
<td>All decoders in the system</td>
</tr>
</tbody>
</table>

`file`

Type: **STRING**

The full filename of the software file.

**Example**

```
update device all Z4K_Firmware_HDMI2.0_v3_5_2_0.apz
Warning:(18) Firmware updating started, use 'show device status' to monitor progress
Success
```
**update server**

Updates the Management Platform software. The server software file uses the `.zyper` extension. Refer to *Updating the Software (page 249)* for more information on using this command.

**Syntax**

```
update server file
```

**Parameters**

`file`

Type: **STRING**

The full filename of the software file.

**Example**

```
update server new-software-file.zyper
Success
Server rebooting; connection will end
```

**Important Note:**

The ZyPer MP update file will be available in three, platform-specific versions. Please use the correct version for the hardware platform being updated.

- ZyPerMP NUC computer: `update_nuc_2.2.xxxxx.zyper`
- ZyPerMP Proserver: `update_proserver_2.2.xxxxx.zyper`
- ZyPerMP VMware: `update_vm_2.2.xxxxx.zyper`
4 Event Mechanism
events

ZMP Event Mechanism

There are three ways to receive events:
• Second telnet session to receive events asynchronously. Session not used for API commands, only to receive events.
• Browser WebSocket to ZMP server. Allows server to asynchronously send events to the browser.
• Reliable, low-overhead API command to poll for events.

Event Message Format

Event::<name>::<source>::<date>::<lastChangeId>::: <Message>

Where:

source  device-name or “server”

Example:

Telnet Event Session

• Client telnets to the ZMP server as normal
• API prompt received
• Command entered: “events”
  o Causes the event mode to be entered
  o Server sends initial events (described below) and new events as they occur to this telnet session
  o Any character entered to the server causes the mode to exit back to the API prompt

Browser WebSocket

Client usage of a WebSocket to receive events is quite simple. Example JavaScript from the sample zyper.html file shows how to connect to the websocket server on ZMP. Upon connection, initial events (described below) will be sent, and then any new events as they occur.

```javascript
eventSock = new WebSocket("ws://rey:8001", "zeeVeeLogging"
eventSock.onopen = eventSockOpened;
eventSock.onMessage = eventRcvd;
eventSock.onclose = eventSockClosed;

function eventSockOpened() {
    eventSock.send("Send Events"); // ignored by server
}
function eventRcvd(event) {
    var evWin = document.getElementById('eventWindow');
    evWin.innerHTML += event.data + "<br>
    evWin.scrollTop = evWin.scrollHeight;
}
function eventSockClosed() {
    console.log("EVENT SOCK CLOSED");
}
```
API Polling

The “show events since <id>” command may be used over telnet or from a browser using AJAX/JSON and preferably long-polling. It is a simple, low overhead and very reliable mechanism to ensure all events have been received.

```
Zyper$ show events since 0
server(172.16.2.169);
  server.event.0; event="Mon Jun 18 18:44:06 2018: ip=172.16.2.64, state=down>
server.event.1; event="Mon Jun 18 18:44:10 2018: state=up"
server.event.2; event="Mon Jun 18 18:44:10 2018: state=up"
... server.event.28; event="Tue Jun 19 05:00:03 2018: sizeX=1280->720, sizeY=720->480, fps=60.00->60.00"
server.event.29; event="Tue Jun 19 05:01:24 2018: cable=disconnected"
server.event.30; event="Tue Jun 19 05:01:26 2018: cable=connected"
server.event.31; event="Tue Jun 19 05:01:26 2018: sizeX=720->1280, sizeY=480->720, fps=60.00->60.00"
lastChangeId(32);
Success
Zyper$
Zyper$ show events since 28
server(172.16.2.169);
  server.event.28; event="Tue Jun 19 05:00:03 2018: sizeX=1280->720, sizeY=720->480, fps=60.00->60.00"
server.event.29; event="Tue Jun 19 05:01:24 2018: cable=disconnected"
server.event.30; event="Tue Jun 19 05:01:26 2018: cable=connected"
server.event.31; event="Tue Jun 19 05:01:26 2018: sizeX=720->1280, sizeY=480->720, fps=60.00->60.00"
lastChangeId(32);
Success
Zyper$
Zyper$ show events since 32
lastChangeId(32);
Success
Zyper$
```

Initial Events

Upon entering telnet “events” mode, or upon a WebSocket connection, the server will send a DeviceStatus event for each known device. Each of these events will have lastChangeId set to 0.
Event List

ServerIpChanged:

**Message:** ipAddress=<from>-><to>

**Example:**

```
ipAddress=169.254.1.10->172.16.2.22
```

ServerStateChange:

**Message:** state=<from>-><to>

**serverState:**
- down
- initialization
- master
- slave-sync
- slave
- slave-switching-over
- slave-db-updating
- not-participating
- slave-waiting-for-master
- slave-version-mismatch

**Example:**

```
state=slave->master
```

NewServer:

**Message:** id=<id>, ip=<ipAddr>, state=<serverState>

**Example:**

```
id=693EF360-B908-11DC-9EA5-10BF483EF417, ip=172.16.2.22, state=initialization
```

OtherServerStateChange:

**Message:** ip=<ipAddr>, state=<from>-><to>

**Example:**

```
ipAddress=169.254.1.10->172.16.2.22, state=slave->master
```
DeviceStatus: initial device state

Message: state=down
Message: state=up, uptime=<seconds>, cable=disconnected
Message: state=up, uptime=<seconds>, cable=connected, sizeX=<pixels>, sizeY=<pixels>, fps=<fps>
Message (DECODER): state=up, uptime=<seconds>, cable=connected, sizeX=<pixels>, sizeY=<pixels>, fps=<fps>, receivingVideoFromEncoder r=no|yes|yes-with-warning [, reason=<reason> | warning=<warning>]

“no” reason list:
- decoder not joined
- decoder down
- decoder hdmi down
- encoder down
- encoder stream disabled
- encoder hdmi down
- display does not support resolution
- encoder and decoder hdcp do not match
- encoder has unsupported color format
- encoder data rate exceeded
- decoder data rate exceeded
- multiview error -- do ’show multiviews status’
- decoder resolution < UHD; can’t join multiview
- encoder resolution < UHD; can’t join video-wall
- encoder has multiview conflict with genlock
- problem with network connection

“yes-with-warning” warning list:
- multiview partially active: do ’show multiviews status’

Examples:
state=down
state=up, uptime=1234, cable=connected, sizeX=3840, sizeY=2160, fps=60,
receivingVideoFromEncoder=no, reason=encoder hdmi down

DeviceStateChange: device up/down

Message: state=up|down
Example:
state=up

CableConnection

Message: cable=connected|disconnected
Example:
Event::CableConnection::EE5(d8:80:39:9b:c:e5)::Jun-18-02:42:56:PM::15:::
cable=connected
VideoStatusChange: sending video or not and why

Message: receivingVideoFromEncoder=no|yes|yes-with-warning [, reason=<reason> | warning=<warning>]

Example:
receivingVideoFromEncoder=no, reason=encoder hdmi down

ResolutionChange: just resolution change

Message: sizeX=from->to, sizeY=from->to, fps=from->to

Example:
sizeX=1920->3840, sizeY=1080->2160, fps=59.95->59.94

VideoChanged: encoder only, non-resolution change

Message: interlaced=<from>-><to>, color=<from>-><to>,
colorDepth=<from>-><to>, hdcp=<from>-><to>, hdcpVersion=<from>-><to>, hdmi20=<from>-><to>

Where:
Interlaced: yes, no
Color values: RGB, YUV444, YUV422, YUV420
colorDepth: 8, 10, 12
hdcp: yes, no
hdcpVersion: none, 1.4, 2.2
hdmi20: yes, no

Example:
interlaced=yes->no, color=RGB->YUV444, colorDepth=8->10, hdcp=yes->no, hdcpVersion=1.4->2.2, hdmi20=no->yes

RS232Data

Message: data=<rs232Data>

Example:
data="hello there"

Note: RS232 events are only sent after a termination character has been received. If there are no termination characters defined, an event is generated after 10ms of no additional input.
Event Mechanism

IRData

Message: data=<irData>

Example:

```
Event::IrData::DCD(d8:80:39:9a:d0:cd)::Jun-19-05:02:07:PM::133:::
data="0000006d0000002700ae00a70016000f001500100015000f00150
0100015000f001500340016000f0015000f0015000f00150010001400100
0140010015000f01400100080016003501600340016003400160000f0
0150010015000f01500100015000f0015001000140010014001001
500f00150034001600330016003400160034001600330016003300160-
034001600330016017c"
```

AutoEdidSelect

Message: sourceDecoder=<dec>, edidValid=yes|no, pixClockMhz=<from>-<to>, color=<from>-><to>, colorDepth=<from>-><to>, onlyPcmAudio=<from>-><to>

Example:

```
sourceDecoder=D14, edidValid=yes, pixClockMhz=150->600, color=RGB->YUV420, colorDepth=8->10, onlyPcmAudio=no->no
```

MulticastConflict

Message: conflict=<multicastAddr>, action=getting new address

Example:

```
conflict=224.1.1.1, action=getting new address
```

AllocMcastFailed

Message: allocation=failed

Example:

```
allocation=failed
```
EdidFirstChecksumInvalid

Message: firstChecksum=invalid

Example:

Event::EdidFirstChecksumInvalid::EE5(d8:80:39:9b:c:e5)::Jun-18-02:42:56:PM::15::: firstChecksum=invalid

EdidSecondChecksumInvalid

Message: secondChecksum=invalid

Example:

IRDongleButtons

Message: data=<irDongleButtons>

Note this event is closely related to the IrData event. If the IrData “data” matches known pattern for IrDongleButton, it will trigger the IRDongleButtons event as shown below.

Examples:

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:26:PM::28::: button0=open, button1=open

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:32:PM::30::: button0=open, button1=closed

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:35:PM::31::: button0=open, button1=open

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:38:PM::32::: button0=open, button1=open

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:41:PM::33::: button0=open, button1=closed

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:44:PM::34::: button0=closed, button1=closed

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:47:PM::35::: button0=open, button1=closed
5 SNMP and LLDP
ZyPer Management Platform SNMP and LLDP support

The ZyPer Management Platform provides SNMPv2c and SNMPv3 access to status and configuration for the server and all devices. Specifically, it provides access to:

- Server information and configuration
- General device status and configuration (common to encoders and decoders)
- Decoder-specific status and configuration
- Encoder-specific status and configuration

The SNMP MIB, ZEEVEE-MIB.txt, may be obtained from www.zeevee.com. The MIB (Management Information Base) provides variable definitions for the above data. Note that ZEEVEE-MIB.txt imports several other standard MIBs, which are also available from the ZeeVee website for convenience.

The ZMP SNMP implementation also supports the following standard MIBs for generic host management:

- SNMPv2-MIB
- IF-MIB
- IP-MIB
- TCP-MIB
- UDP-MIB

And finally, a very common companion to SNMP is LLDP – Link Layer Discover Protocol. ZMP runs an LLDP daemon that collects link neighbor information. That information may be retrieved using SNMP to create a network topology map. ZMP supports the standard MIB, LLDP-MIB.txt, to enable this.

SNMP Agent SNMPv3 Account Configuration

ZMP SNMPv3 implements a simplified User-based Security Model (USM). Client accounts use MD5 authentication without encryption and are only read-only.

Further, ZMP effectively does not implement the View-based Access Control Model (VACM), in that each account has access to the entire mib.

From the ZMP CLI, the following commands manage SNMPv3 accounts:

```
add snmp user v3 accessLevel readOnly encrypted no username <newSnmpUser> password <string>
delete snmp user v3 username <string>
show snmp users
```

For example, to add user testAccount, with a password, myPassword, the following would be entered:

```
Zyper$ add snmp user v3 accessLevel readOnly auth MD5 encrypted no username testAccount password myPassword
```
Zyper$ show snmp users
snmp(172.16.2.169);
    snmp.user: version=v3, auth=MD5, encryption=none,
    username=testAccount

SNMP Agent SNMPv2c Account Configuration

SNMPv2c accounts are based only on a username, although SNMP calls it a “community”. There is no secure authentication of the user and no encryption.

As with V3, ZMP effectively does not implement VACM – that is, each user/community has access to the entire mib.

From the ZMP CLI, the following commands manage SNMPv2c accounts:
    add snmp user v2c accessLevel readOnly community <string>
    delete snmp user v2c community <snmpUser>
    show snmp users

For example:
    Zyper$ add snmp user v2c accessLevel readOnly community public

    Zyper$ show snmp users
snmp(172.16.2.169);
    snmp.user: version=v3, auth=MD5, encryption=none,
    username=testAccount
    snmp.user: version=v2c, community=public

SNMP Client
Choose an SNMP client. There are many. The following examples use the client applications provided in the Linux Net-SNMP package.
SNMP

Examples using Linux Net-SNMP and the above V3 account to retrieve the “zvzServerInfo” group of variables defined in the ZEEVEE-MIB.txt file:

```
bin $ snmpwalk -u testAccount -l authNoPriv -A myPassword 172.16.2.169 zvzServerInfo
ZEEVEE-MIB::zvzServerInfoHostname.0 = STRING: rey
ZEEVEE-MIB::zvzServerInfoVersion.0 = STRING: 2.1.35413:35414
ZEEVEE-MIB::zvzServerInfoPreviousVersion.0 = STRING: N/A
ZEEVEE-MIB::zvzServerInfoSerialNumber.0 = STRING: ZZMPFB0002b3913cf8A
ZEEVEE-MIB::zvzServerInfoUptime.0 = Timeticks: (0) 0:00:00.00
ZEEVEE-MIB::zvzServerInfoLicenseLimit.0 = INTEGER: 0
ZEEVEE-MIB::zvzServerInfoKnownDevices.0 = INTEGER: 12
ZEEVEE-MIB::zvzServerInfoDevicesUp.0 = INTEGER: 7
ZEEVEE-MIB::zvzServerInfoDevicesExceeded.0 = INTEGER: 0
```

And a similar example using the V2c account created above:

```
bin $ snmpwalk -v2c -c public 172.16.2.169 zvzServerConfig
ZEEVEE-MIB::zvzServerConfigAutoEdidMode.0 = INTEGER: enabled(1)
ZEEVEE-MIB::zvzServerConfigHdmiAudio.0 = INTEGER: allowCompressed(1)
ZEEVEE-MIB::zvzServerConfigLicense.0 = STRING: none
```

SNMP Notifications

There are four different types of SNMP Notifications. The original was for SNMPv1. That format is no longer in use. Then came v2C, which is very easy to use, but not used often due to lack of authentication or encryption. SNMPv3 has two different notification mechanisms. They both use the same format as defined in SNMPv2c, but add authentication and encryption. The first v3 notification is still called a trap. It is similar to v2c in that it is unreliable – the trap sender sends it over UDP and forgets. The configuration required for this form of notification is surprisingly terrible, and for that reason, not supported by ZMP. The final notification form is called an “Inform”. This is the same as the trap, but reliably sent. The receiver must acknowledge the inform, and the send must try a number of times until an acknowledgment is received. Interestingly, using the Inform is not very hard.

NOTE: Roles are reversed for notifications! ZMP is the client and your trap server… is the server. That means that to receive either v2c traps, or v3c informs, you must configure your trap daemon with the correct authentication and access control. As a warning, the net-snmp trap daemon, as with its snmp daemon, is just bit tricky to use.
From the ZMP CLI, the following commands manage notification generation:

```
add snmp trapServer v2cTrap ipAddress <address:ip>
   community <string>
add snmp user v2c accessLevel readOnly community
   <newSnmpCommunity>
   add snmp user v3 accessLevel readOnly auth MD5 encrypted
no username <newSnmpUser> password <string>
   delete snmp trapServer v2cTrap <address:ip> community <string>
   delete snmp user v2c community <snmpCommunity>
   delete snmp user v3 username <snmpUser>
   show snmp trapServers
   show snmp users
```

More Technical Information on the Linux Net-SNMP Package

If NetSNMP is installed on Ubuntu Linux, then you either have to install the mibs in /usr/share/snmp/mibs, or use the -M command line switch to *fully* specify the path (cannot use the ~ character). For example, if the mibs are placed under your home directory, “snmp-mibs”, the following will work:

```
snmpwalk -M +${HOME}/snmp-mibs -m all -u testAccount -l authNoPriv -A myPassword 127.0.0.1 zvzServerInfo
```

Note the above example uses the account and password created in the earlier example. Further, if the mibs are copied to the /usr/share/snmp/mibs directory, then the -M in the above command may be omitted.

Note also that the Ubuntu net-snmp directory structure does not follow the man pages for net-snmp apps. Very annoying. However, any ZMP system (including in-house servers and build systems), the “standard” directories are followed. In this case, the mib directory is /usr/local/share/snmp/mibs.
6 Appendix

There are three ways to receive events:

•
Updating the Software

Using Mac OS X

1. Make sure the Management Platform is powered and is working correctly.

2. Download the latest software from the ZeeVee website. Make note of the location of where the software was downloaded.

3. Launch the Terminal app, found under the Applications > Utilities folder. By default, the current directory will be the Home directory.

   Last login: Tue Mar 22 14:24:08 on console
   Andrews-MacBook-Pro:~ Andrew$

4. Change the directory to the location of the downloaded software file. For example, if the software was downloaded to the Desktop, then change to the Desktop folder, as shown:

   Last login: Tue Mar 22 14:24:08 on console
   Andrews-MacBook-Pro:~ Andrew$ cd desktop
   Andrews-MacBook-Pro:desktop Andrew$

5. Use the FTP protocol to login to the Management Platform. At the terminal prompt, type the following and press the [ENTER] key.

   Andrews-MacBook-Pro:desktop Andrew$ ftp 192.168.1.6

6. Enter the user name and password. Use anonymous for the user name and use guest for the password. The password will not be echoed to the screen.

   Andrews-MacBook-Pro:desktop Andrew$ ftp 192.168.1.6
   Connected to 192.168.1.6
   220 (vsFTPd 3.0.2)
   Name (192.168.1.6:Andrew): anonymous
   331 Please specify the password.
   Password:
   230 Login successful.
   Remote system type is UNIX.
   Using binary mode to transfer files.
   ftp>

7. Type cd files at the ftp prompt to change to the /files directory.

   ftp> cd files
   250 Directory successfully changed.
   ftp>
Enter and run the `put` command, followed by the full name of the software file, as shown. Make sure to replace `[version]` with the version of the filename you are using. For example:

```
ftp> put update_nuc_2.2.36708.zyper
```

8. Press the [ENTER] key. Information similar to the following will be displayed.

```
local: update_nuc_1.07.1.33348.zyper remote: update_nuc_1.7.1.33348.zyper
229 Entering Extended Passive Mode (|||35257|).
150 Ok to send data.
100% |****************************************| 6830 KiB 94.30 MiB/s 00:00 ETA
226 Transfer complete.
6994519 bytes sent in 00:00 (92.30 MiB/s)
```

9. Type the `exit` command to exit FTP.

```
ftp> exit
Andrews-MacBook-Pro:desktop Andrew$
```

10. Telnet to the Management Platform, as shown.

```
$ telnet 192.168.1.6
Trying 192.168.1.6...
Connected to 192.168.1.6
Escape character is `^[`.
zyper$
```

Use the `update` command to update the Management Platform. Once entered, the Management Platform will reboot and the software will be updated. Note that the connection will be lost, temporarily, during the update process.

```
zyper$ update server update_nuc_2.2.36708.zyper
Success
Server rebooting; connection will end
```
Using Windows

1. Make sure the Management Platform is powered and is working correctly.

2. Download the latest software from the ZeeVee website. Make note of the location of where the software was downloaded.

3. Open Chrome and enter the IP address of the Management Platform using the FTP protocol. For example:

   \texttt{ftp://169.254.185.207}

4. The /files folder will be displayed.

5. Drag-and-drop the latest software file to the /files folder.

6. Use the Telnet protocol to access the Management Platform API.

7. Use the \texttt{update} command to update the Management Platform. Once entered, the Management Platform will reboot and the software will be updated. Note that the connection will be lost, temporarily, during the update process.

   \texttt{zyper$ update server update_nuc_1.7.1.33321.zyper}

   Success

   Server rebooting; connection will end
Using ZyPer Management Platform

1. Make sure the Management Platform is powered and is working correctly.

2. Download the latest software from the ZeeVee website. Make note of the location of where the software was downloaded.

3. Login to the ZyPer Management Platform. Refer to Accessing ZMP (page 13) for more information.

4. Click the Server option at the left of the page.

5. Scroll down within the Server pain until you see the option to Update Server Software. Drag the latest software into the box and press Update Server to begin process. (Note: You can also revert the server to the previously installed version of software by clicking the Revert Server button) “Show advanced controls” must be enabled to use this option.
**Important Note:**

The ZyPer MP update file will be available in three, platform-specific versions. Please use the correct version for the hardware platform being updated.

- ZyPerMP NUC computer: update_nuc_2.2.xxxxx.zyper
- ZyPerMP Proserver: update_proserver_2.2.xxxxx.zyper
- ZyPerMP VMware: update_vm_2.2.xxxxx.zyper
Redundancy Configuration Instructions

To configure redundancy, follow the steps below. The secondary server must be running for the redundancy fields to be visible in ZMP or the API.

Configuring redundancy through the API

Configuring the IP Address
1) Login to the main ZMP, or Master through telnet.
2) Issue the “set server redundancy all-servers” command to configure redundancy.
   
   IE: set server redundancy all-servers virtual-ip address 172.16.5.239 network-interface video

3) Use the “show server redundancy” command to review the redundancy configuration and confirm the changes.
4) Login to the Secondary server, or Slave, through telnet.
5) Use the “show server redundancy” command to review the redundancy configuration and confirm the changes.

Configure the preferred roles
1) Login to the Master ZMP through telnet.
2) Issue the “set server redundancy this-server” command to set the preferred master and slave states on the server.
   
   IE: set server redundancy this-server preferred-master true preferred-slave false

3) Use the “show server redundancy” command to review the redundancy configuration and confirm the changes.
4) Login to the Slave ZMP through telnet.
5) Use the “show server redundancy” command to review the redundancy configuration and confirm the changes.

Configuring redundancy through ZMP
1) Login through you Master ZMP GUI with Chrome.
2) Open the Server Panel.
3) Scroll down to the Redundancy fields.
4) Set the fields listed below.
Virtual IP: The IP address that the Master and Slave servers will use. This IP address must be unique and available on the network as it will be used for telnet access for the API as well as ZMP.

Virtual Mask: The subnet mask for the virtual interface, must be correct for the IP address listed above and not it should not conflict with the main eth0 interface.

Preferred Roles Radio Button: The preferred roles for the server. This field is used to decide the Master or Slave upon both servers initializing at the same time. Although rare, this can occur.

State: The current role of the current Server connected to.

After configuration is complete on the Master, the information should populate to the Slave server. The preferred roles for the Slave server will still need to be configured. This can be done by logging into ZMP using the Slave server IP address and modifying the Preferred roles.

The “State” field will reflect the servers current state.

5) After the configuration changes are made, login into ZMP with the Virtual IP address configured above.

The server panel should show the correct redundancy information.

Note: The “switchover” button above will allow the servers to swap roles as needed.
Virtual interface on the ZMP.

Below is an example of the output of the “ifconfig” from the ZMP showing the virtual IP configured on the current master server.

```
eth0    Link encap:Ethernet  HWaddr 40:8d:5c:32:46:0e
        inet addr:172.16.5.240  Bcast:172.16.5.255  Mask:255.255.255.0
