Safety Instructions

1. Read these instructions.
2. Keep these instructions.
3. Heed all warnings.
4. Follow all instructions.
5. Do not use this product near water.
6. Clean only with a dry cloth.
7. Do not block any ventilation openings. Install in accordance with the manufacturer’s instructions.
8. Do not install or place this product near any heat sources such as radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat.
9. Do not defeat the safety purpose of a polarized or grounding-type plug. A polarized plug has two blades with one wider than the other. A grounding type plug has two blades and a third grounding prong. The wide blade or the third prong are provided for your safety. If the provided plug does not fit into your outlet, consult an electrician for replacement of the obsolete outlet.
10. Protect the power cord from being walked on or pinched particularly at plugs, convenience receptacles, and the point where they exit from the apparatus.
11. Only use attachments/accessories specified by the manufacturer.
12. To reduce the risk of electric shock and/or damage to this product, never handle or touch this unit or power cord if your hands are wet or damp. Do not expose this product to rain or moisture.
13. Unplug this apparatus during lightning storms or when unused for long periods of time.
14. Refer all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as power-supply cord or plug is damaged, liquid has been spilled or objects have fallen into the apparatus, the apparatus has been exposed to rain or moisture, does not operate normally, or has been dropped.
15. Batteries that may be included with this product and/or accessories should never be exposed to open flame or excessive heat. Always dispose of used batteries according to the instructions.
The ZyPer Management Platform includes the ZMP web interface. The following browsers are supported:

- Google Chrome version 55.0.2883 or greater

Refer to the Support page on the ZeeVee web site to download the latest firmware.

Features and Package Contents

Features

• Pre-configured Linux O/S is maintenance-free and includes upgrades and support.

• Plug & Play operation will discover and enable labeling and control of any number of ZyPer4K, ZyPerUHD or ZyPerHD encoders and decoders.

• **Note:** Release 2.3.x was the final release to support the ZyPerHD

• Interface allows the independent routing of video, audio and control signals.

• The feature-rich API makes ZyPer4K / ZyPerUHD / ZyPerHD the perfect add-on to existing distribution systems without the time and dollars usually required for custom programming.

• Presets enable signal routing and scheduling of saved, pre-defined source-display settings for easy duplication and recall.

• Real time system monitoring includes generating alerts for offline or disconnected ZyPer4K / ZyPerUHD / ZyPerHD devices, sources and displays.

• Auto detection/discovery of additional encoders and decoders make system scaling a snap.

• Easily create and manage video walls of any pattern or configurations up to a 15x15 array.

• Create and manage Multi-view displays with up to 19 sources. *(ZyPer4K only)*
New in Release 2.3 / 2.4 / 2.5

New Features 2.3 / 2.4

• Additional Multiview preset patterns. (ZyPer4K only)
• Clock added to Preset Calendar.
• Copy/Clone command added for Multiview. (ZyPer4K only)
• License count only applies to ZyPer4K units. Non ZyPer4K units do not count against license limit.
• Channel up/down command added for Multiview windows. (ZyPer4K only)
• Update ZyPerUHD “No Source Found” background from ZMP GUI.
• Ability to enable or disable viewing of IP address and firmware version in ZyPerUHD “No Source Found” screen. (Release 2.3.37261 and newer)
• Updated help search features for API
• Release 2.4 includes update to Linux version 20.04 on the new NUC form factor Management Platform. (See hardware specifications in Section 1)

New Features 2.5

• Update ZyPerUHD “No Source Found” background from ZMP API.
• Maximum supported video wall size increased to 15x15 for ZyPerUHD
• Ability to disable 5V HDMI line on ZyPer4K-XS/XR decoders when no video routed to the decoder.
• Ability to issue a channel up or channel down command to ZyPer4K decoder via a ZeeVee IR remote control or ZyPer Trigger. Requires ZV IR RX unit.
New in Release 2.3

ethernetManagementPort changed to utilityPort

The 1Gb port on ZyPer4K units was referred to as the ethernetManagementPort in previous releases of the API. With release 2.3 this is now changed to utilityPort.
New in Release 2.3 / 2.5

New/Updated Commands 2.3  (See API Command Listing)

- clone multiview
- dumpusb
- load encoderEdid
- set decoder osdStatusMode
- set device
- set multiview
- set preset

New/Updated Commands 2.5  (See API Command Listing)

- load idleImage
- set decoder hdmi5vControl  (ZyPer4K-XS and ZyPer4K-XR only)
- set device irProcessing (ZyPer4K only)
- set server discoverMode
- set terminal output
The following items/features have been removed

- **Mobile Support.** The ZMP no longer supports mobile platforms such as tablets. (Note: this support was removed in release 2.2)

- **Note:** If non-tablet device somehow gets put into “Tablet” mode you can force it out of tablet mode by appending ?desktop=true to the end of the browser address. Example: http://172.16.6.111/maestroz/app/?desktop=true

- **Note:** Release 2.3.x will be the final release to support the ZyPerHD

Ethernet Port 0 = Video Port. DHCP default IP Address
Video Port connected to same network with ZyPer Endpoints
Ethernet Port 1 = Management Port.
Management Port connected to other network (if used)
Static IP Address 192.168.20.2 Subnet Mask = 255.255.255.0
Installation

1. Connect the included power supply to the power receptacle on the ZyPer Management Platform.

2. Connect the included AC power cord from the power supply to an available electrical outlet.

3. Connect an Ethernet cable from the ZyPer Management Platform to a switch that is on the same LAN that will be hosting the ZyPer devices. Although the ZyPer Management Platform can be connected anywhere on the LAN, it is recommended that it is connected to the primary switch where the ZyPer endpoints are connected.

   **NOTE:** If the ZyPer Management Platform does not detect a DHCP server within 60 seconds, a link-local address of 169.254.xxx.xxx will be assigned to the ZyPer Management Platform. If you wish to use static or fixed-mapping using DHCP, then see Network Configuration (page 8).

Using Windows®

a. Connect an Ethernet cable from your computer to the same switch as above.

b. Go to the **Network** folder.

c. Locate the icon titled “ZyPer Management Server” followed by an IP address. This is the IP address of the ZyPer Management Platform.

Using OS X®

a. Connect an Ethernet cable from your computer to the same switch as above.

b. Open the Terminal application.

c. **At the prompt, enter** `ping zyper.local`.

d. The IP address of the ZyPer Management Platform will be displayed.
4. Open a web browser and enter the IP address of the ZyPer Management Platform.

5. The login screen for the ZMP will be displayed.

6. Enter admin for both the Username and Password fields. See Management Platform Login (page 7) for more information.

7. Click the Login button.
Management Platform Login

1. Directly connect an HDMI cable (NUC) or VGA cable (Rack Mount) between the Management Platform and a Display. (Note that a USB keyboard is also required to be connect to the Management Platform)

2. After boot the login prompt will appear. At the login prompt, enter the following login name: zyper

After entering the login name, the password prompt will be displayed.

zyper login: zyper
Password:

3. Enter the password. The default password is zyper. Note that the password will not be echoed to the screen. Once the password is entered, the screen will appear similar to the following:

zyper login: zyper
Password:

4. Use the show server info command to find the IP Address of the Managament Platform

show server info
server(192.168.0.22);
  server.gen; hostname=zyper.local, version=2.3.36999,
  previousVersion=2.2.36870,
  macAddress=94:c6:91:a0:47:fc, serialNumber=ZZM1K400011D
  server.gen; uptime=3d:21h:25m:24s, freeMem= 6.71GB, bootCount=173
  server.gen; runningInVm=false
  server.ipActive; ipServerAddr=192.168.0.22, ipManagementAddr=NA,
  gatewayAddr=none, dnsAddr=none
  server.time; time="Tue Aug 31 08:43:59 2021",
  timezone=America/New_York
  server.pollStats; count=0, interval: 0-minutes, monListSize=0
  server.license; productID=F9188182-AF72-C6C8-92C6-94C691A047FC,
  license=none
  server.license; Zyper4KLimit=24, Zyper4KDevices=6, allDevices=12,
  allDevicesUp=6, Zyper4KDevicesExceeded=0
  server.deviceUpdates; active=0
  server.activeDeviceVersions; num_0.0.0.0=1, num_2.0.4.0=2,
  num_4.1.2.0=3
Success
Network Configuration

The default configuration of the Management Platform will use DHCP with link-local addressing support. Link-local addressing allows the Management Platform to have an IP address on a network, even if the Management Platform has not been manually configured or automatically configured by a DHCP server. If a DHCP server is not detected within 60 seconds, a link-local address of 169.254.xxx.xxx will be assigned to the Management Platform.

If you wish to use a static IP address, this can be done in one of two ways: Add a fixed mapping to the DHCP server or by directly assigning a static address to the Management Platform. Both methods are covered in this section.

Fixed Mapping using DHCP

Before continuing, make sure that the static IP address being used does not conflict with any DHCP-assigned addresses. Contact your system administrator for assistance.

1. At the login prompt, enter the following login name: zyper

After entering the login name, the password prompt will be displayed.

zyper login: zyper
Password:

Enter the password. The default password is zyper. Note that the password will not be echoed to the screen. Once the password is entered, the screen will appear similar to the following:

Zyper$

Use the show server info command to find the Mac Address of the Management Platform.
show server info
server(192.168.0.22);
    server.gen; hostname=zyper.local, version=2.3.36999,
previousVersion=2.2.36870,
    macAddress=94:c6:91:a0:47:fc, serialNumber=ZZM1K400011D
    server.gen; uptime=3d:21h:25m:24s, freeMem= 6.71GB, bootCount=173
    server.gen; runningInVm=false
    server.ipActive; ipServerAddr=192.168.0.22, ipManagementAddr=NA,
gatewayAddr=None, dnsAddr=None
    server.time; time="Tue Aug 31 08:43:59 2021",
timezone=America/New_York
    server.pollStats; count=0, interval: 0-minutes, monListSize=0
    server.license; productId=F9188182-AF72-C6C8-92C6-94C691A047FC,
license=none
    server.license; Zyper4KLimit=24, Zyper4KDevices=6, allDevices=12,
allDevicesUp=6, Zyper4KDevicesExceeded=0
    server.deviceUpdates; active=0
    server.activeDeviceVersions; num_0.0.0.0=1, num_2.0.4.0=2,
num_4.1.2.0=3
Success

After programming the DHCP server to assign a specific address to the Management Platform, reboot the Management Platform, using the following command, to use the new IP address.

restart server
Success

Static IP Configuration

Before continuing, make sure that the static IP address being used does not conflict with any DHCP-assigned addresses. Contact your system administrator for assistance.

Using the set server ip command can be used to set the IP Address of the Management Platform. Refer to API Command Listing (page 84) for a full listing of available commands.

set server ip server static 192.168.1.26 255.255.255.0 none none
reboot
Success
2 Basic Operation
1. Open a web browser and enter the IP address of the Management Platform.

2. The login screen for ZMP will be displayed.

3. Enter the required information in the **Username** and **Password** fields. The default username and password is `admin`. The username and password are case-sensitive. The “admin” password may be changed by the user at any time.

4. Click the **Sign In** button.

5. The **Home** page will be displayed. See the next section for more information.
Home Page

The **Home** page of the ZyPer Management Platform displays all available **Sources**, **Displays**, **Walls**, **Zones**, **Multiviews**, **Server Info**, **Users**, **Roles**, **Logs** and **Help**.

1. Login to the ZMP. Refer to [Accessing ZMP (page 11)] for more information.

2. The **Home** page will be displayed. The **Sources** pane displays all available **encoders**. The **Displays** pane displays available **decoders**. **Walls**, **Multiview**, **Zones**, **Presets**, **Source Grid**, **Display Grid**, **Server**, **Users** and **Roles** will be covered in upcoming sections.
Device Status Indicators

Each Source and Display contains a status indicator border color, displaying current information about the device. This is particularly useful for devices that may be in a separate part of a building or several miles away.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Indicator Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>OK</td>
<td>Green</td>
</tr>
</tbody>
</table>

1. Indicates that an HDMI cable is connected between the encoder and the source or between the decoder and a display or other sink device. Decoder is receiving a valid video stream.

2. The encoder / decoder is powered.

3. The Ethernet cable is connected between the switch and the encoder / decoder.

<table>
<thead>
<tr>
<th>Meaning</th>
<th>Indicator Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warning</td>
<td>Yellow</td>
</tr>
</tbody>
</table>

1. HDMI cable may not be connected between the encoder and the source or between the decoder and a display or other sink device. Decoder may not be receiving a valid video stream.

Note that this indicator may also indicate a faulty HDMI cable.

2. The encoder / decoder is powered.

3. The Ethernet cable is connected between the switch and the encoder / decoder.
<table>
<thead>
<tr>
<th>Meaning</th>
<th>Indicator Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Red</td>
</tr>
</tbody>
</table>

1. The Ethernet cable is *disconnected* between the switch and the encoder / decoder.

2. The encoder / decoder may not be powered.
Basic Operation

Displaying Devices By Status

Both the Sources and Displays window contain a Filter by status option. There are check boxes to filter by Status (Green, Yellow, Red), Device Type (4K, UHD or HD), USB (Present, Not present). There is also an option to filter Sources or Displays by name.

1. Click the Filter Icon.

2. Only those devices with the selected status will be displayed. As illustrated in this example, only ZyPer4K devices are shown in the Sources window. ZyPerHD and ZyPerUHD sources are filtered out.

3. Select every box from the Filter to show all devices.
Displaying Devices By Name

Both the Sources and Displays windows contain a Filter by name field. Use this field to enter the name of the desired device(s) to be displayed. As text is entered, the interface automatically begins a search of the current string for each recognized device. Devices that are displayed must contain the text (in sequence) that is currently in the Filter by name field. Text searches are case-sensitive.

1. Click in the Filter by name field.

This example uses the following named sources. For more information on naming sources see Configuring Encoders and Decoders (page 21).

2. Type the desired sequence of characters in the Filter by name field to search. In this example, we want to only display the “Wildlife” source devices. To do this, we can enter part of the name, such as “Wild” or even “W” (since no other device name contains the character “W”). All text entries are case-sensitive.
Manually Setting Sort Order

Both the Sources and Displays windows can be sorted manually. Every device is assigned a “sort order” number. The user can change this sort order number manually.

1. Click on the device identifier. (Little “4K” or “UHD” or “HD” in upper left corner of device.) Note: Must be configured for Join Mode rather than Preview Mode. See the section on Video Preview mode on the following pages.

   ![Sources Window]

   This will bring up a Sort Order option for the selected device. The example below the device is assigned to Sort Order position 1. (Top Left of the Source window) This number can be changed to any number desired up to the number of sources.

2. Sort Order numbering runs from top left to bottom right. In the image above assuming only 5 sources, the top three would be location 1, 2 and 3; while the bottom two would be locations 4 and 5.
Joining Encoders to Decoders

“Joining” is the process of assigning an encoder (source) to a decoder (display) or a video wall. Before starting the join process, we recommend that you configure the encoder and decoder settings. Refer to Configuring Encoders and Decoders (page 21).

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Drag and drop the desired source on to the desired display.

3. The display icon will change to show that it has now been joined with a source. (Small chain link icon) Hover over the chain link for additional status info. Also the icon will change to match the source and name of the source will appear at the top of the icon.

4. Continue the join process as desired. Note that joining an encoder with a decoder that is already joined, will replace the previous join operation.

The join command can also be used to perform the same operation. See API Command Listing (page 85) for more information.
Unlinking Encoders and Decoders

As mentioned earlier, joining an encoder with a decoder that is already joined, will replace the previous join operation. However, there may be situations where you want to completely remove any source from being shown on a display. To do this, use the Disconnect AV feature or Disconnect Joins.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. On the Sources window, right-click on any Source. Select Configure Join and then Disconnect AV.

3. Drag that source onto the Display that you would like to unlink

4. Alternately you can right click on the “Chain Link” icon and select “Disconnect Joins”

5. The display icon will change to show that it has been unlinked and no longer joined with any encoder. (Yellow perimeter, small chain link icon is gone, icon returns to default and name of joined source is gone)
Video Preview Stream

It is possible to view a small thumbnail preview of the active stream in the GUI within either the encoder or decoder box. Once preview streams are enabled, you can see them by following the steps below: (Supported on ZyPer4K and ZyPerUHD only) Not supported on ZyPer4K-XS or ZyPer4K-XR units.

**Note:** It will take several seconds for the preview stream to appear once activated. There is a maximum of 20 preview streams available at any given time.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. On the **Sources** window, click on the small “4K” or “UHD” located in the upper left corner of the window. This will toggle the GUI between showing an icon and showing the preview stream. **Note:** Video Preview Mode but be set at shown in step 3 below.

3. Click on the gear icon in the top right corner of the ZMP to enable or disable the “Big Preview” option. When enabled, hovering the cursor over a preview stream will make the preview approximately 50% larger while you keep the cursor over the stream.

4. Note that preview stream can be viewed for both **Sources** and joined **Displays**. All other functionality remains the same. The preview stream updates about 1 time per second. (Multiviews are not available as preview streams. Clicking on preview at the decoder for a multiview will give the appearance that the multiview has failed.)

5. Important Notes: The PC/Laptop attempting to view preview streams **MUST** have access to the Internet to download a player in the background. **ZyPer4K MUST** be on firmware version 4.0.1 or newer.
Source/Display Config Page

Configuring Encoders and Decoders

When an encoder or decoder is connected to the network, the Management Platform identifies each unit by its MAC address. This is the default setting. However, when dealing with several units, it is much easier to identify a unit by a string name. It is also possible to assign a preset image to each icon, set the network mode, RS232 settings, and more.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Source or Displays tab at the left of the page. Joining Encoders to Decoders (page 18)

3. All available encoders will be displayed under the Sources window. (Maximum 25 per page. Deployments with more than 25 encoders will cycle thru pages)
All available decoders will be displayed under the **Displays** window. (Maximum 25 per page. Deployments with more than 25 decoders will cycle thru pages)

Pagination: Note that you can control the number of Sources or Displays shown at one time via the pagination option in the browser:

Add `?max=5` to the end of the browser address to set max Sources/Displays to 5. Valid numbers are 1 thru 25.

Example: `http://172.16.6.111/maestroz/app/?max=5`
4. Left-click the desired encoder name to display the context menu. In the example below, we will select the encoder named “Cuba”.

5. A menu will appear with options for Summary, ID, Status, Config and Actions.

6. Selecting the ID option will allow you to manually give the Source a name.

7. Enter a description for the source in the Name field. By default, the Management Platform will use the MAC address of the encoder. This field cannot be blank. Names cannot contain spaces. In this example, we will use “ESPN1”.

Naming a device can also be done using the set device general name command. See API Command Listing (page 85) for more information.
8. Click the **Config-Icon** drop-down list to select the desired icon for this source. This is optional. If no icon is selected, then the default icon will be used. In this example, we will select **ABC**, since a **ABC** is connected to this encoder.

The `set device source-display iconImageName` command can also be used to assign an icon to a device. See API Command Listing (page 85) for more information.

9. Enter the **Manufacturer**, **Model**, and **Serial Number** of the source or display in the appropriate fields. By default, these fields are set to “none”. These fields must not be blank. If a custom value is provided, it must not contain spaces.
The Manufacturer, Model, and Serial Number can also be assigned using the following commands, respectively. See API Command Listing (page 84) for more information.

- set device source-display manufacturer
- set device source-display model
- set device source-display serialNumber

10. Enter the location of the source or display device in the Location field. By default, this field is set to “Unknown”. This field must not be blank. If a custom value is provided, it must not contain spaces.

11. The set device source-display location command can also be used to set these values. See API Command Listing (page 85) for more information for more information.

12. Use the Config-IP Mode section to configure the IP setting for the encoder. By default, both encoders and decoders are set to DHCP mode and will be discovered automatically by the Management Platform. To manually configure the IP settings of the encoder, click the Mode drop-down list and select static. Once in static mode, the information in the Address, Mask, and Gateway fields can be edited.
13. Use the **Baudrate** section of **Config** to configure the RS232 settings for the control device, such as an automation control system. Click the **Baudrate** drop-down list to select the desired baud rate of the control device.

   
   ![](image)

   The **Device IP** settings can also be assigned using the `set device ip dhcp` and `set device ip static` commands. When assigning **RS232** settings from the command line, use the `set device rs232` command. See **API Command Listing** (page 85) for more information.

14. By default, ZyPer4K and ZyPerUHD Encoder audio format parameters will inherit the Server Default configuration.

   **Only PCM** - Ignore the Server Default setting and restrict the EDID to PCM audio only

   **Allow Compressed** - Ignore the Server Default setting and allow Compressed audio on the encoder.

   **NOTES:** For this setting to work properly, the source’s audio configuration should be set to automatically determine audio, if possible. If the source is not able to automatically determine audio, it needs to be manually set to the desired auto format. Downmixing hdmi audio (sending audio out of the analog port) can only be done if the hdmi stream is PCM – not compressed.

   ![](image)
Encoder and Decoder Status Information

You can obtain status information about an encoder and its source at any time, from the Source Config page.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Left-click the desired source name and select the Status option from the context menu.

<table>
<thead>

Deleting, Rebooting or Resetting an Encode or Decoder

If an encoder or decoder is disconnected from the network, the Management Platform will continue to display the encoder or decoder within the ZMP until it is removed. Note that; reconnecting the encoder or decoder will cause it to once again be displayed in the ZMP.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Sources tab at the left of the page.

   - To delete an encoder or decoder:
     a. Left-click on the desired encoder or decoder name and select Actions from the context menu.
b. Click the **Delete** button.

![Image of the Actions menu with options for CEC and RS232 settings, including buttons for Reboot, Factory Defaults, and Delete.]

3. The following prompt will be displayed when deleting a *source*.

**Are you sure?**

Would you like to delete device Cuba?

- **Cancel**
- **Delete**

4. Click the **Delete** button to confirm the operation. Click the **Cancel** button to cancel the operation.

5. This same menu can be used to Reboot the device or set the device back to Factory Defaults by clicking the appropriate button.
Sending a CEC Command

Both the ZyPer4K and ZyPerUHD can send CEC on/off commands from within ZMP. The ZyPer4K can send additional CEC hex commands as well.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Source tab at the left of the page.

   ▶ To send a CEC command:

      a. Left-click on the desired encoder or decoder name and select Actions from the context menu.
b. Click the desired **CEC On** or **OFF** button. (ZyPer4K or ZyPerUHD)

3. The ZyPer4K can also send Hex commands over CEC. Just type the Hex command into the box. When completed, click anywhere outside of the Hex input box to send the command.
Basic Operation

Sending an RS232 String Command

Both the ZyPer4K, ZyPerUHD and ZyPerHD can be sent RS232 strings from the ZMP to be output on the RS232 port of the unit.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Source tab at the left of the page.

- To send an RS232 string command:
  a. Left-click on the desired encoder or decoder name and select Actions from the context menu.
b. Scroll down to the RS232 box and enter desired text. Click anywhere outside the box to send the text string command.
Updating Firmware

If there is a firmware update available for the ZyPer4K, ZyPerUHD or ZyPerHD, the update can be performed easily from within ZMP.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Source tab at the left of the page.

   ▶ To delete an encoder or decoder:
     a. Left-click on the desired encoder or decoder name and select Actions from the context menu.
b. Drag and drop the appropriate firmware update file into the box and click on the “Update Device” button.

3. You will be prompted to confirm this the desired action. Confirm the action by clicking the Update button. The ZyPer unit will automatically reboot itself once the firmware update is complete.

Are you sure?

Would you like to update the device NBC with Z4K_Firmware_HDMI2.0_v4_0_1_0.apz?

[Cancel] [Update]
Creating Video Walls

One of the purposes of the Management Platform is to create and manage video walls. A video wall is a collection of displays or projectors arranged in a square or rectangular fashion. The source is then “mapped” to each display, thereby creating one large display from multiple, smaller displays.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Walls tab at the left of the page.

3. In the Walls pane, click on the + button to create a new video wall.
4. This will bring up the wall Editor.

5. Enter the number of display columns in the **Number of Columns** field.

6. Enter the number of display rows in the **Number of Rows** field.

In this example, we have arranged our displays in two rows and two columns. This is a blank 2x2 *video wall*.
7. Drag Displays from the **Display** pane into the Editor to populate the wall. Provide a name for the new video wall in the **Name** field. Values in this field cannot contain spaces. Since more than one video wall can be created, always be sure to provide a descriptive name. This field cannot be blank.

8. Leave the **Bezel Top**, **Bezel Bottom**, **Bezel Left**, and **Bezel Right** set to 0. Bezel compensation will be covered in the next section.

9. Click the **Create** button.

10. The new Wall will now be available within the Walls window.

11. Video Walls are deleted by clicking on the small Trash Can icon. The user will be prompted to confirm deletion.

**Are you sure?**

Would you like to remove "wall1" video wall?

[Cancel]  [Remove]
Bezel Compensation

Every video output device has an area where video is not displayed. This area is called the **bezel**. **Bezel compensation** takes this area into account when a single video source is divided and displayed on multiple output devices.

1. Check the output on the video wall and identify any misaligned edges. For best results, it is recommended to use a static video pattern for this test.

   In the illustration on the left, we have a 2x2 video wall without **bezel compensation**. Note the ZeeVee logo is not aligned correctly across all four displays. On the right, **bezel compensation** is used to fix the issue.

   ![Without Bezel Compensation](without-bezel-compensation.png) ![With Bezel Compensation](with-bezel-compensation.png)

   It is recommended that when the video wall is set up for the first time, that these values be set to zero. **Bezel compensation** can be changed at any time.

   **Bezel compensation is always measured in pixels.**

2. Left click the edit video wall button in the lower left corner of the desired wall.

   ![Walls (1)](walls-1.png)
3. The video wall editor will come back up onto the screen.

4. Enter the desired values, in pixels, for each bezel field: **Bezel Top**, **Bezel Bottom**, **Bezel Left**, **Bezel Right**.

5. Once the desired values have been entered, click the **Update** button. This will save the new settings.

6. Check the picture on the displays. Repeat steps 2 - 5 as necessary.

7. **Note:** Only the ZyPer4K allows bezel adjustment. Video walls with the ZyPerHD or ZyPerUHD do not allow bezel adjustment.

8. **Note:** If the PLUS sign or trash can for multiviews or video walls is not visible in your browser; the display may have entered into tablet mode. You can force the system back to “Desktop” mode with the following command line addition in the browser. Add /?desktop=true. **Example:** http://172.16.6.111/maestroz/app/?desktop=true
Creating a Multiview Screen

One of the purposes of the Management Platform is to create and manage multiview screens. A multiview screen is a collection of sources arranged on a single display. There can be up to 19 sources displayed on a single display in a variety of preset patterns.

**Note:** Only the ZyPer4K versions with the HDMI 2.0 feature support multiview screens. This feature is not supported by the ZyPerHD, ZyPerUHD or ZyPer4K units with only HDMI 1.4 support.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the **Multiview** tab at the left of the page.

3. In the **Multiview** pane, click on the **+** button to create a new video wall.

4. This will bring up the Multiview editor where you can create and customize a multiview display.
5. Click on the **Patterns** button in the lower right corner to bring up a list of pre-defined patterns.

6. After selecting a pattern you will see the grid fill in with the places to drag sources.
7. Drag sources into the various locations. Note: The same source can be dragged into multiple windows as long as the windows are the same size. Dragging a source onto different size windows is NOT supported.
8. If desired, assign Audio from one of the Sources. This is done by clicking on one of the small Audio symbols in the top center of each Window. Note that only audio from one source is supported.

9. Give the Multiview a name and press the **Save** button.

10. To use the Multiview, drag the newly created multiview onto a Display in the **Display** pane.

You can rename or create a copy of a multiview by going back into any existing multiview and clicking the Copy/Rename button next to the Save button.

Click “Enable Copy”, enter the new multiview name and click Save.

Click “Enable Rename”, enter the new name for existing multiview and click Save.
Creating Zones

In many installations, displays are placed in more than one room. These rooms are often referred to as zones. Creating a Zone, using the Management Platform, allows you to organize these displays in a group. Video Walls can also be added to Zones.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Zones option at the left of the page.

3. In the Zones window, click on the + symbol to add a Zone.
4. This will open the Zones Editor. Drag Display and Video Walls into the Zone from the Displays or Walls windows.

5. Continue adding the desired displays (or video walls) to the drop-pane.

6. Provide a name for the Zone. If a custom name is used, it must not contain spaces. In this example, we will call our Zone, “ConferenceRm”, since our displays are installed in a conference room. It is recommended that a unique and descriptive name be used to identify each Zone.
7. Click the **Create** button to save the **Zone**. Close the editor window to exit without saving changes.

8. The new **Zone** will appear under the **Zones** window.

9. Zones are deleted by clicking on the small Trash Can icon. The user will be prompted to confirm deletion.
Creating Presets and Schedules

Presets are snapshots of a system configuration at a given time. You can save presets to the system and return to these configurations manually or via the scheduling function.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.
2. Click the **Presets** option at the left of the page.

3. In the Presets/List window, click on the ✨ symbol to add a Preset.
4. This will open the **Create Preset** window. Enter a name and description for this preset.

5. You can now Create the preset using the current state of the system. “Create with Existing Connections” or you can “Create with No Commands” and add the API commands manually.

6. The example above is “Create with Existing Connections”. Notice the relevant API commands to return to the current system state are listed under Commands: You can manually edit this list to add/remove/change commands as desired. Hit the Exit key when done creating the preset.
7. The created preset is now available. Options include, running the preset manually, editing the preset, scheduling the preset, showing a log of when preset was run and deleting the preset.

8. To add the preset to the schedule/calendar click the small calendar icon. (3rd icon in). This will open the window shown below. Click the + symbol to “Add Schedule”.

9. Assign a name to the schedule here. It can be the same as the preset name or something different. Select the date of the month - enter value 1 - 31. Please a checkmark next to All for everyday of the month. Day of the Week - Select day to run Preset by day of week, weekend, weekday, or all. Weekends are Saturday and Sunday, and Weekdays are Monday - Friday. Hour - Values range 0 - 23. Minute - values range 0 - 59. Select color for the preset to appear in the calendar page. Click Create when done.
10. In the example below the name of the Schedule is “Opening Time” and has been set to occur every day at 7am. Click the X next to “Schedule For Preset Morning” to exit this page.

11. This preset will now appear in the Calendar page.

12. You can add as many preset configurations to the calendar as you like. You also run the same preset at different days/times as desired.

**Note:** The following API commands are used to manually configure NTP servers or set the time for customers without Internet access or a local time server:

- `set server date ntpServer address <domainName>`
- `set server date manual month <int> day <int> year <int> hour <int> minute <int>`
13. The Calendar can be viewed in Month, Week, Day or Agenda mode.

Week Mode shown below:

Day Mode shown below:

Agenda Mode shown below:
Source Grid Page

This page is used to show all encoders in a text based grid. Information shown includes device name, type, MAC address, Model, IP address and EDID. The user can also export the entire contents of the Source Grid to a .CSV file.

Source Grid

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Source Grid option at the left of the page.

3. Source Device/Encoder information will be shown in a grid format. There are independent tabs for Status, Routing, Config, VidoeIn, Network, EDID, Firmware and RS-232. You may want to close other windows to be able to maximize the size of the grid.
4. The Status tab shows basic information and allows a quick diagnostic by clicking the Diag button. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

5. The Routing tab allows you to manually route RS-232 and IR signals. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

6. The Config tab will let you change encoder names and manually restart or factory default the encoders. The user can also change Icons associated with the encoder; including the ability to upload custom Icons. (JPG and PNG formats are both acceptable) Click the small arrow next to the Icon to bring up a menu of available options. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
7. The VideoIn tab shows information about connected source Color Space and Resolution. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

8. The Network tab has details such as IP address and Subnet Mask. The user can also enable or disable the 1Gb Utility Port on the ZyPer4K. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

9. The EDID tab will show current EDID information allowing the user to manually assign an EDID to the encoder if desired. Click the small arrow in the Filename column for a specific encoder to change the EDID. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
10. The Firmware tab will show the current version of firmware installed on the encoders and allow you to manually update to another version if needed. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

11. The RS-232 tab will show current RS-232 configuration settings and allow you to make changes. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
12. Exporting the Source Grid to a CSV file

Clicking on the 3 parallel bars from any tab in the Source Grid will allow you to save the Source Grid contents to a CSV file.

Select the Export/Import option.

Note that there is a check box in the upper left allowing you to select all columns to be exported. You can also individually select what columns you wish to export.

Once you click the Export CSV button, the file will be downloaded to your computer. The CSV file can be opened and viewed by many applications including Microsoft Excel.

The CSV can be edited and uploaded back into the system if desired. Using the process above, drag the edited CSV file into the “Load CSV data file” box and click the Import to Grid button.
Display Grid Page

This page is used to show all decoders in a text based grid. Information shown includes device name, type, MAC address, Model, IP address, EDID and Connected Encoder. The user can also export the entire contents of the Display Grid to a .CSV file.

Display Grid

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Display Grid option at the left of the page.

3. Display Device/Decoder information will be shown in a grid format. There are independent tabs for Status, Routing, Config, VideoOut, Network, EDID, Firmware and RS-232. You may want to close other windows to be able to maximize the size of the grid. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
4. The Status tab shows basic information and allows a quick diagnostic by clicking the Diag button. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

5. The Routing tab allows you to manually route Video, Video Wall, USB, RS-232 and IR signals. Make changes by clicking into the small down arrow. Field will turn green indicating an upcoming change. Press the Apply button to implement the change. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

6. The Config tab will let you change decoder names and manually restart or factory default the decoders. It also lets you know what video port is active if more than one port is available and if the Analog audio output is being used. You can also change the ZyPerUHD default “No Source Found” background screen. (IdleImage) Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

**Note:** IdleImage must be 1280x720 in size and will output from decoder at that resolution.
7. The VideoOut tab shows information about the resolution source, scaling mode, color space and active resolution. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

8. The Network tab has details such as IP address and Subnet Mask. The user can also enable or disable the 1Gb Utility Port on the ZyPer4K. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

9. The EDID tab will show current EDID information for the connected display and allows the save the EDID to a file. Click the Save button to save the EDID. Note that both a text and binary version will be saved and available to the user. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.
10. The Firmware tab will show the current version of firmware installed on the decoders and allow you to manually update to another version if needed. Note that clicking the 3 horizontal lines in the top right will allow you to show or hide columns.

12. Exporting the Display Grid to a CSV file

Clicking on the 3 parallel bars from any tab in the Display Grid will allow you to save the Display Grid contents to a CSV file.

Select the Export/Import option.

Note that there is a check box in the upper left allowing you to select all columns to be exported. You can also individually select what columns you wish to export.

Once you click the Export CSV button, the file will be downloaded to your computer. The CSV file can be opened and viewed by many applications including Microsoft Excel.

The CSV can be edited and uploaded back into the system if desired. Using the process above, drag the edited CSV file into the “Load CSV data file” box and click the Import to Grid button.
Server Functions Page

The majority of this page is used to display general information about the Management Platform. In addition, this page provides controls for setting the EDID mode and rebooting or restarting the server. Server firmware can also be updated from this window. For detailed instructions on how to update the ZMP, please refer to appendix 5.

Server Information

This section provides information about the Management Platform, such as the host name, IP address, MAC address, version, serial number, uptime duration, and free memory.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Server option at the left of the page.

3. Information about the Management Platform will be displayed in the Server pane.

<table>

</tbody>
</table>
Setting the EDID Audio Mode

EDID Audio setting will specify at the encoder if only raw PCM audio is acceptable to the system or if encoded/compressed audio formats are supported.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Server tab at the left of the page.

3. EDID information will appear in the Server window under the Status information. You may need to scroll down in the window to see the EDID information.

Note: There is a check box at the bottom of the Server window for “Show advanced controls” This box must be checked to enabled changing of the EDID mode setting.
Server Reboot, Shutdown and Trouble Report

The Management Server can be rebooted or shut down from the Server window. Each option affects the Management Server in different ways, as listed below.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Server tab at the left of the page.

3. Reboot and Shutdown options will appear in the Server window under the Status information. You may need to scroll down in the window to see these options.

4. Click the desired button under Actions.

   ► **Reboot**
   Linux is rebooted.

   ► **Shut Down**
   Shuts down the Management Server.

   ► **Trouble Report**
   Generates a trouble report than can be provide to ZeeVee support.
Server License and Update

The License for the Management Server can be updated to increase the maximum number of supported endpoints and their Server software version can also be updated.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.
2. Click the Server tab at the left of the page.
3. Scroll down to the License option.

4. Record the Product ID number and provide this to ZeeVee. This ID is used by ZeeVee to generate the new license key when purchased by a customer.

5. Once received, you can enter a new license key as provided by ZeeVee to increase the limit on the number of endpoints. (Please contact ZeeVee support for additional information)

6. Please see the Appendix of this document for information on updating the Server Software. Note: In a redundant environment, Software must be updated on slave first, then switchover, then update on new slave. See online help section 15.2
Help Page

The Help page provides a help reference for each page within the ZMP.

1. Login to the ZMP. Refer to Accessing ZMP (page 11) for more information.

2. Click the Help tab at the left of the page.

3. The Management Platform Help window will be displayed.

4. Click the desired section. As the mouse pointer moves over each section, the text will become underlined.
Users and Roles Pages

The **Users** page provides the ability to create additional users beyond the Administrator and in conjunction with the **Roles** page assign different access/abilities to each user.

1. Login to the ZMP. Refer to [Accessing ZMP](#) (page 11) for more information.

2. Click the **Users** tab and **Roles** tab at the left of the page.

3. The Management Platform **Users** and **Roles** windows will be displayed.

The first User shown in the Users window is Admin. The Admin account cannot be deleted and the name cannot be changed. You can however change the password from the default of “admin” to a password of your choosing.

Click on the edit icon within the Admin user. The following screen will appear and allow you to change the password.
Enter the new password on both the “Password” and “Password Validation” lines and then hit the “Save” button in the lower right corner.

It is recommended to record this new password in a secure location.
Adding a New User

To create a new user click on the “+” symbol in the Users window. The screen shown below will appear. Enter the Full Name, User ID and Password for the new user. You can keep this password or force the user to generate a new password the first time they login by clicking the “Force password change on next sign in” box.

Save the user by clicking the Save button in the lower right corner.
Adding or Editing a Role

To create a new role click on the “+” symbol in the Roles window. The screen shown below will appear. In the General tab enter the Role Name. In the example below the name is “Junior Admin”.

The next thing you will need to do is assign Permissions to this new role. To do this click on the Permissions tab.
There are 10 categories that can be assigned different levels of access within the Permissions tab. Sources, Displays, Zones, Walls, Multiview, Logs, Help, Users, Roles and Server. Most categories have 2 or 3 levels of access:

**View:** User is allowed to access the designated tab within ZMP

**Config:** User is allowed to alter or create new configurations within the designated tab. For example the user can create a new Wall, Multiview or Zone.

**Admin:** User has full functional control over configurations, including ability to delete sources and displays.

Click on the appropriate levels of access to set permission. The process is color coded to make it easier. Green = Full access, Yellow = Partial access, Red = No access.

Be sure to Save any changes before moving to the step of assigning specific users these permission levels.
You need to have both the Users and Roles windows visible to assign a User with a set of Roles / Permissions. Open the Users tab in the Roles window and drag a specific User from the User window over. (Drag the “person” icon located to the far left next to user ID)

Be sure to Save any updates.

In example above, “Art” was dragged over to “Junior Admin” role. Be sure to Save this setting before closing the Roles window.
3 Advanced Operation
**Accessing the API**

**Using Telnet**

Telnet is a popular protocol that can be used on both Windows® and Mac OS® operating systems to connect to the programming shell. On a Windows operating system, a Telnet client, such as “PuTTY”, must be installed. From a Unix or Mac OS command line, use the `telnet` command followed by the IP address of the Management Platform:

```
telnet 192.168.1.6
```

Instead of specifying the IP address of the Management Platform, the following identifier can also be used: `zyper.local`

Example: `telnet zyper.local`

Telnet will use port 23 by default and once connected, the API prompt will be displayed:

```
Zyper$
```

**Getting Help**

To make it easier to find commands, help now supports groups.

- `help` – lists all groups
- `help <group>` -- lists commands within a group.
  
  Note: The same command may appear in more than one group.

- `help all byGroup` – lists all groups and all commands in each group
- `help all alphabetical` – list all commands in alphabetical order

Help is available in two forms. Typing `help` or `?` at the prompt will list all available commands:

```
Zyper$ help all alphabetical

Help All Commands Alphabetical
  add device ipAddress <ip>
  add snmp trapServer v2cTrap ipAddress <address:ip> community <string>
  ...
  ...
  update device <deviceNamePart>|all|encoders|decoders <filename>
  update server <filename>

Success
Zyper$
```
Zyper$ help
Help Groups
  Audio
  CEC
  Data
  Decoder/Display
  Device
  Diagnostics
  EDID
  Encoder/Source
  Events
  HDCP
  Join
  Multicast
  Multiview
  Preset
  PreviewStreams
  Redundancy
  SNMP
  Script
  Serial/IR
  Server
  Status/Config
  USB
  Video
  VideoWall
  Zone
Enter 'help <group>', or 'help all byGroup', or 'help all alphabetical'
Success

In addition, a partial list of commands can be listed by specifying the first word of each command. The first part of the command must be specified before the help command. For example, the following will only list command with the join prefix.

Zyper$ join help
join <encoderMac|encoderName>|none <decoderMac|decoderName|zoneName>.zoneName> analogAudio
join <encoderMac|encoderName>|videoSource|none <decoderMac|decoderName|zoneName>.zoneName> hdmiAudio
join <encoderMac|encoderName|multiviewName>|none <decoderMac|decoderName> multiview
join <encoderMac|encoderName>|none <decoderMac|decoderName|zoneName>.zoneName> video.fastSwitched|genlocked|genlockedScaled
join <encoderMac|encoderName>|none <wallName> videoWall
join <encoderMac|encoderName>|none <decoderMac|decoderName> usb
join <encoderMac|encoderName>|none <decoderMac|decoderName> window
viewportSource <x:int> <y:int> <sizeX:int> <sizeY:int> viewportDest <x:int> <y:int> <sizeX:int> <sizeY:int>

Zyper$
In addition, help can be searched by keyword.  help search <string>

(Note: Feature added to release 2.3.37234 and newer)

Zyper$ help search layer
set multiview <multiviewName> windowNumber <int> encoderName
<encoderName>|none percentPositionX <float> percentPositionY <float>
percentSizeX <float> percentSizeY <float> layer <int>
set multiview <multiviewName> windowNumber <int> encoderName
<encoderName>|none pixelPositionX <int> pixelPositionY <int> pixelSizeX <float> pixelSizeY <int> layer <int>
set multiview <multiviewName> windowNumber <int> layer <int>
Success

Zyper$ help search audio
join <encoderMac|encoderName>|none <decoderMac|decoderName|zoneName|zoneName>.zoneName> analogAudio
join <encoderMac|encoderName>|videoSource|none <decoderMac|decoderName|zoneName|zoneName>.zoneName> hdmiAudio
set encoder <encoderMac|encoderName> analogAudioOut source none|hdmiAudioDownmix
set encoder <encoderMac|encoderName> edid audio onlyPcm|allowCompressed|serverDefault
set decoder <decoderMac|decoderName> analogAudioOut source analogAudio
set decoder <decoderMac|decoderName> hdmiAudioOut source analogAudio|hdmiPassthroughAudio|hdmiAudio|hdmiAudioDownmix
set multiview <multiviewName> audioSource windowNumber <int>|none
set server encoderDefault edid audio onlyPcm|allowCompressed
start encoder <encoderMac|encoderName> stream video|videoScaled|hdmiAudio|analogAudio
stop encoder <encoderMac|encoderName> stream video|videoScaled|hdmiAudio|analogAudio
Success

Zyper$ help search create
create multiview <newMultiviewName>
create presetNew <newPresetName> commands existingConnections|empty
create presetSchedule <presetName> schedule <newPresetScheduleName>
create videoWall <newWallName>
create zone <[zoneName.]newZoneName>
Success
Setting the Time Zone

The Management Platform can use the Network Time Protocol (NTP) to set the date and time. However, the time zone will need to be specified. Alternately the date and time can be set manually.

1. Telnet to the Management Platform.
   
   telnet 192.168.1.6

2. After the connection has been established, use the `set server timezone` command to set the time zone.

   Zyper$ set server timezone America/New_York
   Success
   Zyper$

3. To set date/time manually use the `set server date manual` command.

   Zyper$ set server date manual month 4 day 1 year 2021 hour 15 minute 1
   Success
   Zyper$

Use the `show server info` command to verify the correct time zone has been set.

Zyper$ show server info
server(192.168.1.78);
   server.gen; hostname=zyper.local, version=2.0.35220, previousVersion=2.0.35125, macAddress=1c:1b:0d:82:ff:1a,
   serialNumber=ZZM1H500032B
   server.gen; uptime=0d:0h:13m:13s, freeMem=7.007GB, bootCount=6
   server.gen; runningInVm=false
   server.time; time=Thu Apr 25 22:15:34 2019, timezone=America/New_York
   server.license; productId=031B021C-040D-0582-FF06-1A0700080009,
   license=JSGH-RLUH-0000-116F-9328-F426-4BB5-89E2-024D-8CBE-FF1C
   server.license; limit=unlimited, knownDevices=16, devicesUp=0, devicesExceeded=0
   server.deviceUpdates; active=0
   Success
   Zyper$
EDID Management

Auto EDID Mode

By default, Auto EDID mode is enabled. This means that the Management Platform will compare the encoder EDID with the decoder EDID. If they are different, then the EDID from the decoder (sink) will be used by the encoder (source). Setting the EDID Mode affects all join modes: fast-switched, genlocked, and video-wall. Refer to the join command in the API Command Listing (page 84) section for more information.

Using Custom EDID Data

There may be some instances where a custom EDID is desired. One example is when using a single encoder with multiple displays, such as a video wall. In such a case, follow the steps below to save and load a custom EDID to the Management Platform.

1. Telnet to the Management Platform.
   
   telnet 192.168.1.6

2. Disable Auto EDID mode by entering the following command:

   zyper$ set server auto-edid-mode disabled
3. Use the `save device-edid` command to save the EDID of the sink device (attached to the decoder) to the Management Platform, using the following convention:

```
save device-edid [id] [filename]
```

Make sure to replace `[id]` with the identifier of the sink device containing the EDID you wish to capture. You can specify either a MAC address or a name identifier. Follow the identifier with the name of the EDID file. For example:

```
zyper$ save device-edid SonyXBR4 myEDID
```

4. After executing this command, two files will be created under the following directory:

```
/srv/ftp/files/myEDID
/srv/ftp/files/myEDID.txt
```

`myEDID` is a binary EDID data file in standard format. `myEDID.txt` contains the decoded EDID in standard ASCII text.

These files must remain in this directory when disabling Auto EDID mode.

5. To force a ZyPer encoder to use the saved EDID you need to have the MP load the binary EDID file onto the desired encoder.

```
zyper$ load encoder-edid [id] saved [filename]
```

Make sure to replace `[id]` with the identifier of the source device you want to load the EDID onto. You can specify either a MAC address or a name identifier. Follow the identifier with the name of the EDID file. For example:

```
zyper$ load encoder-edid BlueRay1 saved myEDID
```

6. To return to Auto EDID mode, for any reason, enter the following command at the prompt:

```
zyper$ load encoder-edid BlueRay1 auto
```

or

```
zyper$ set server auto-edid-mode enabled
```
Using AJAX/JSON

The AJAX/JSON programming interface allows developers to control the Management Platform within browser-based applications. All calls to the server are asynchronous post/receive operations using Javascript and do not require any specific HTML or CSS code. We will present two examples in this section: Login authentication and command request/response.

Login Authentication

There are two methods to authenticate with the server. The first and recommended method is to pass the username and password to rcLogin.php. The second method is to pass the username and password in every AJAX request.

Once the server accepts the username and password, it will generate a secure cookie called "userToken". This cookie will expire one hour after the last AJAX command is received by the server. After the cookie expires, all other AJAX requests will result in a failed authentication until rcLogin.php is called again. The following code excerpt is from the zyperLogin() function within zyper.html:

```javascript
... ...
xmlhttp=new XMLHttpRequest();
xmlhttp.onreadystatechange = function(){
  if (xmlhttp.readyState == 4 && xmlhttp.status == 200){
    procLoginResp(xmlhttp.responseText);
  }
}
postdata = "";
postdata += encodeURIComponent("serverSocketName") + '=' +
  encodeURIComponent(socketName) + '&'
  encodeURIComponent("username") + '=' +
  encodeURIComponent(username) + '&'
  encodeURIComponent("password") + '=' +
  encodeURIComponent(password) + '&';
xmlhttp.open("POST", url, true);
xmlhttp.setRequestHeader("Content-Type", "application/x-www-form-urlencoded");
xmlhttp.send(postdata);
}

The response is a string value. The variable resp can be "Success", "Failed", or "Server not running".

function procLoginResp(jsonData) {
  var resp = JSON.parse(jsonData);

  ... ...
Advanced Operation

Command Request / Response

After login, any further commands are sent to the rcCmd.php.

The following code excerpt sends an AJAX request to list all ZyPer encoders and decoders:

```javascript
function zt(){
    xmlhttp = new XMLHttpRequest();
    xmlhttp.open("POST", url, true);
    xmlhttp.setRequestHeader("Content-Type", "application/x-www-form-urlencoded");
    xmlhttp.onreadystatechange = function(){
        if (xmlhttp.readyState == 4 && xmlhttp.status == 200){
            procResp(xmlhttp.responseText);
        }
    }
    xmlhttp.send(encodeURIComponent("commands:show device-status all"));
}
```

In this example, the `encodeURIComponent` function has two parts: The request type, which is `commands` and the command `show device-status all`. Refer to the `show device status` command for more information. Currently, `commands` is the only request type that is supported and only a single command can be supplied for each request.

Here, we handle the AJAX response:

```javascript
function procRespTest(jsonData){
    var jsData = JSON.parse(jsonData);
    # jsData.status may have the values:
    # "Success"
    # "Request failed authentication"
    # "Server not running"
    # "no commands provided"
    #
    if (jsData.status == "Success"){
        var element = document.getElementById("responseError");
        element.innerHTML = jsData.responses[0].error;
        element = document.getElementById("responseWarning");
        element.innerHTML = jsData.responses[0].warning;
        element = document.getElementById("numObjectsInResponse");
        element.innerHTML = jsData.responses[0].text.length;
    }
    else{
        // Failed authentication
    }
}
```

The JSON data is decoded using the `JSON.parse()` method. In this example, information about the response data is displayed on the web page (HTML code not shown).
The JavaScript object that is returned is:

```javascript
var jsObj = {
    status: true | false;
    responses: [ {error: "errorText",
                  warning: "warningText",
                  text: [ { param1: "val1", parmN: "paramN" } ]
             }
             ];
};
```

The return value is an object that contains two members: `status` and `responses`. If the `status` member is not equal to "Success", then the `responses` member is not valid. If the request fails authentication, then the `status` value will be "Request failed authentication". Note that there may be other web-server level failures that can be returned in the `status` string.

The second member in the returned object, `responses`, which is an array of objects. Each of these objects contains three members: `error`, `warning`, and `text`. The `error` and `warning` members are strings. The `text` member is an array of objects with the desired parameters and values. If the `error` string is non-null, then the `warning` and `text` members will be null. If `text` is non-null, then the `warning` string may still be valid.

Currently, the `responses` member is always an array size of 1.
Advanced Operation

Fast-Switched vs. Genlocked Mode

The ZyPer4K provides two uniquely different modes for joining video/audio between a source (encoder) and display (decoder). The chart below details the differences between these two modes.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Fast-Switched</th>
<th>Genlocked</th>
</tr>
</thead>
<tbody>
<tr>
<td>Latency</td>
<td>1-frame of latency. (16-33ms depending on frame rate of source video)</td>
<td>0 frames of latency. Less than 100μs</td>
</tr>
<tr>
<td>Transition Appearance</td>
<td>Instantaneous if switching between sources at same resolution and frame rate</td>
<td>Visible blanking of display when switching between sources</td>
</tr>
<tr>
<td>Scaling</td>
<td>Automatic scaling up or down to preferred resolution of the display (As determined by display EDID)</td>
<td>Source is not scaled. What comes in at source is presented to display exactly as input. (Note: Special Genlock-scaled mode is available)</td>
</tr>
<tr>
<td>HDR</td>
<td>HDR input is automatically reduced to 8-bits at output</td>
<td>HDR input is maintained exactly as input at the output</td>
</tr>
<tr>
<td>Encoded Audio</td>
<td>AC3 or other encoded audio formats are passed from encoder to decoder (New in 2.0 release)</td>
<td>AC3 or other encoded audio formats are passed from encoder to decoder</td>
</tr>
<tr>
<td>Video Wall</td>
<td>Video walls are technically not supported in Fast-Switched mode. (Join command for walls defaults to Genlock-scaled)</td>
<td>Video walls are technically always in Genlock-scaled mode</td>
</tr>
<tr>
<td>Multiview</td>
<td>Multiview is supported in Fast-Switch mode</td>
<td>Multiview is not supported in Genlocked mode</td>
</tr>
<tr>
<td>Video Disconnect</td>
<td>Disconnecting video (Join None) will maintain a black screen output. (Video is not technically disconnected)</td>
<td>Disconnecting video (Join None) will disconnect the video stream entirely. No video output from decoder</td>
</tr>
<tr>
<td>USB, IR, RS232</td>
<td>None of these items are associated with Fast-Switched or Genlocked mode</td>
<td></td>
</tr>
</tbody>
</table>

Notes: Video Disconnect refers to the existing join between encoder and decoder. If existing join is Fast-Switched then a “Join None” command simply puts out a fully black video output from the decoder. If the existing join is Genlocked, then a “Join None” command disconnects the video stream and nothing is output from the decoder. This can be verified by looking at the VID light on the ZyPer4K decoder.
## API Command Listing

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add device</td>
<td>Manually adds a device to Management Platform</td>
</tr>
<tr>
<td>add snmp</td>
<td>Add new snmp user or trap server</td>
</tr>
<tr>
<td>add zoneDisplay</td>
<td>Adds a display or Video wall to an existing zone.</td>
</tr>
<tr>
<td>channel</td>
<td>Cycles up or down through encoders. Used to change channels.</td>
</tr>
<tr>
<td>clone multiview</td>
<td>Used to clone an existing multiview</td>
</tr>
<tr>
<td>create zone</td>
<td>Creates a new empty zone.</td>
</tr>
<tr>
<td>create multiview</td>
<td>Creates a new multiview display (ZyPer4K family only)</td>
</tr>
<tr>
<td>create videoWall</td>
<td>Creates an empty 2x2 video wall.</td>
</tr>
<tr>
<td>create presetNew</td>
<td>Creates a new preset</td>
</tr>
<tr>
<td>create presetSchedule</td>
<td>Creates schedule for existing preset</td>
</tr>
<tr>
<td>dataConnect</td>
<td>Creates a TCP port connection between devices for IR or RS232</td>
</tr>
<tr>
<td>delete allConfiguration</td>
<td>Deletes all encoder/decoder and server information from the Management Platform.</td>
</tr>
<tr>
<td>delete device</td>
<td>Deletes the specified encoder or decoder from the Management Platform database.</td>
</tr>
<tr>
<td>delete multiview</td>
<td>Deletes the specified multiview from the Management Platform database. (ZyPer4K family only)</td>
</tr>
<tr>
<td>delete multiviewWindow</td>
<td>Deletes a specific window from an existing multiview (ZyPer4K family only)</td>
</tr>
<tr>
<td>delete preset</td>
<td>Used to delete a preset, preset runlog or preset schedule</td>
</tr>
<tr>
<td>delete snmp</td>
<td>Delete SNMP user or trap server</td>
</tr>
<tr>
<td>delete videoWall</td>
<td>Deletes the specified video wall from the Management Platform database.</td>
</tr>
<tr>
<td>delete zone</td>
<td>Deletes an existing zone</td>
</tr>
<tr>
<td>delete zoneDisplay</td>
<td>Removes a display from an existing zone</td>
</tr>
<tr>
<td>diagnostics device</td>
<td>Runs a set of diagnostics on device</td>
</tr>
<tr>
<td>dumpusb</td>
<td>Outputs information about USB devices</td>
</tr>
<tr>
<td>events</td>
<td>Causes the event mode to be entered</td>
</tr>
<tr>
<td>factoryDefaults device</td>
<td>Sets the specified encoder/decoder to factory-default settings.</td>
</tr>
<tr>
<td>flashLeds</td>
<td>Physically identifies the specified encoder/decoder on the network using LED flashes. (ZyPer4K family only)</td>
</tr>
<tr>
<td>join</td>
<td>Switches audio and/or video from source to display or video wall</td>
</tr>
<tr>
<td>join videoSource</td>
<td>Selects audio feed to follow a video join</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>load encoderEdid</code></td>
<td>Uploads an EDID file to the specified encoder</td>
</tr>
<tr>
<td><code>load idleImage</code></td>
<td>Uploads an image to use at UHD background when no video streamed to decoder</td>
</tr>
<tr>
<td><code>logging</code></td>
<td>Used to set logging level and add notes to the log</td>
</tr>
<tr>
<td><code>previewStream</code></td>
<td>Used to turn on/off the preview stream viable in the Management Platform GUI (ZyPer4K family and ZyPerUHD only)</td>
</tr>
<tr>
<td><code>redundancy switchover</code></td>
<td>Swap Management Platform Master and Slave</td>
</tr>
<tr>
<td><code>redundancy delete downServers</code></td>
<td>Removes no longer present servers from list of redundant servers</td>
</tr>
<tr>
<td><code>restart device</code></td>
<td>Restarts the specified encoder/decoder</td>
</tr>
<tr>
<td><code>restart server</code></td>
<td>Restarts the Management Platform</td>
</tr>
<tr>
<td><code>restore server database</code></td>
<td>Restores a saved database</td>
</tr>
<tr>
<td><code>revert server</code></td>
<td>Switch to a previously installed version of the API</td>
</tr>
<tr>
<td><code>save deviceEdid</code></td>
<td>Saves the EDID from a decoder to a local file</td>
</tr>
<tr>
<td><code>save server database</code></td>
<td>Saves current server database to file</td>
</tr>
<tr>
<td><code>save system config</code></td>
<td>Saves current system configuration to a file</td>
</tr>
<tr>
<td><code>send</code></td>
<td>Sends an IR, CEC or RS232 string to the specified device</td>
</tr>
<tr>
<td><code>script</code></td>
<td>Executes the specified AJAX/JSON or text script.</td>
</tr>
<tr>
<td><code>send</code></td>
<td>Sends an IR, RS232 or CEC string to the specified device</td>
</tr>
<tr>
<td><code>set encoder analogAudioOut source</code></td>
<td>Sets the source of Analog audio output for specified encoder (ZyPer4K family only)</td>
</tr>
<tr>
<td><code>set encoder edid audio</code></td>
<td>Sets allowable input audio formats</td>
</tr>
<tr>
<td><code>set encoder hdcpMode</code></td>
<td>Sets the HDCP compatibility at the encoder side</td>
</tr>
<tr>
<td><code>set decoder connectionMode</code></td>
<td>Changes current connection to decoder to fast-switched, genlocked or genlocked-scaled. (ZyPer4K family only)</td>
</tr>
<tr>
<td><code>set decoder displayMode</code></td>
<td>Sets default decoder output to crop, stretch or box</td>
</tr>
<tr>
<td><code>set decoder displayResolution</code></td>
<td>Set decoder output size to auto or manual resolution. (Width, Height, FPS)</td>
</tr>
<tr>
<td><code>set decoder analogAudioOut source</code></td>
<td>Sets the source of Analog audio output for specified decoder</td>
</tr>
<tr>
<td><code>set decoder edidPreferMode</code></td>
<td>Sets the preferred resolution from the display EDID</td>
</tr>
<tr>
<td><code>set decoder hdmiAudioOut source</code></td>
<td>Sets the source of HDMI audio output for specified decoder</td>
</tr>
<tr>
<td><code>set decoder hdmi5vControl</code></td>
<td>Enables or disables HDMI 5V line (ZyPer4K-XS and ZyPer4K-XR only)</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>set decoder osdStatusMode</td>
<td>Enables or disables OSD feature <em>(ZyPerUHD only)</em></td>
</tr>
<tr>
<td>set decoder powerSave</td>
<td>Enables or disables power-save feature <em>(ZyPerUHD only)</em></td>
</tr>
<tr>
<td>set device ethernetManagementPort</td>
<td>Enables or disables the 1G Ethernet utility port for the specified device <em>(ZyPer4K family only)</em></td>
</tr>
<tr>
<td>set device general name</td>
<td>Sets the name for the specified device.</td>
</tr>
<tr>
<td>set device ip dhcp linkLocal</td>
<td>Sets the specified device to DHCP or Link-Local mode <em>(ZyPer4K family only)</em></td>
</tr>
<tr>
<td>set device ip static</td>
<td>Sets the device to static mode <em>(ZyPer4K family and ZyPerUHD only)</em></td>
</tr>
<tr>
<td>set device irProcessing</td>
<td>Configures decoder to process incoming IR commands to issue Channel up/down command <em>(ZyPer4K family only)</em></td>
</tr>
<tr>
<td>set device rs232</td>
<td>Sets the RS232 settings for the specified device</td>
</tr>
<tr>
<td>set device sendIpMcastRange</td>
<td>Sets allowable range of multicast addresses for selected devices <em>(ZyPer4K family only)</em></td>
</tr>
<tr>
<td>set device sourceDisplay iconImageName</td>
<td>Sets the icon image for the specified device.</td>
</tr>
<tr>
<td>set device sourceDisplay location</td>
<td>Sets the location name for the specified device.</td>
</tr>
<tr>
<td>set device sourceDisplay manufacturer</td>
<td>Sets the manufacturer name for the specified device.</td>
</tr>
<tr>
<td>set device sourceDisplay model</td>
<td>Sets the model name for the specified device.</td>
</tr>
<tr>
<td>set device sourceDisplay serialNumber</td>
<td>Sets the serial number name for the specified device</td>
</tr>
<tr>
<td>set device usbFilter</td>
<td>Allows restrictions to USB use on selected device <em>(ZyPer4K family only)</em></td>
</tr>
<tr>
<td>set device videoPort</td>
<td>Selects active input port for ZyPer4K units with multiple inputs <em>(ZyPer4K family only)</em></td>
</tr>
<tr>
<td>set multiview</td>
<td>Assigns source to a position and size within a multiview display <em>(ZyPer4K family only)</em></td>
</tr>
<tr>
<td>set multiview audioSource windowNumber</td>
<td>Selects the input source to provide Audio for multiview display <em>(ZyPer4K family only)</em></td>
</tr>
<tr>
<td>set multiview canvasSize</td>
<td>Specifies Multiview canvas for multiview creation. <em>(ZyPer4K family only)</em></td>
</tr>
<tr>

</tbody>
</table>
add device

Used to manually add a device to the ZyPer Management Platform that are located on a different VLAN/Subnet than the ZMP itself.

A qualified network engineer should be involved in making these configuration updates and the network switch provider may need to be consulted to ensure support of needed features.

Syntax

add device ipAddress ip

Parameters

i

Type: IP Address

The IP address of the device

Example

add device ipAddress 192.168.10.81

Success

Detailed Example

The ZyPer4K Endpoints are located on VLAN 10 and the 192.168.10.X subnet. The ZyPer Management Platform is on VLAN 20 and the 192.168.20.X subnet.

The ZMP will automatically discover any ZyPer4K endpoints located on VLAN 20. The ZMP will NOT automatically discover any ZyPer4K endpoints located on VLAN 10. However, given the proper circumstances, the ZyPer4K endpoints on VLAN 10 can be manually added to the ZMP for control.

For this to work, the network MUST be configured to route traffic between VLAN 10 and VLAN 20. How to configure the network to allow routing between VLANs is beyond the scope this document and should be done by a qualified network engineer. A simple test to confirm routing is that a device in VLAN 10 can ping a device in VLAN 20.

The ZyPer4K endpoints need to have a known IP Address. The IP Address should either be assigned by a DHCP server or assigned statically.

ZyPer4K endpoints need to be added one at a time.

You can get a listing of all "user added" devices with the “show device userAdded” command.
**add snmp**

Creates an new SNMP user or trap server. (Please see Section 5 of this manual for additional details on SNMP support)

**Syntax**

```
add snmp arg name
```

**Parameters**

*arg*

Type: **STRING**

Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trapServer vc2Trap ipAddress &lt;address&gt; community &lt;comm&gt;</td>
<td>Add new trap server at the specified IP Address</td>
</tr>
<tr>
<td>user v2c accessLevel readOnly community</td>
<td>Add new SNMP user</td>
</tr>
<tr>
<td>user v3 accessLevel readOnly auth MD5 encrypted no username &lt;name&gt; password &lt;password&gt;</td>
<td>Add new SNMP user</td>
</tr>
</tbody>
</table>

*name*

Type: **STRING**

IP address of trapserver or name of new SNMP user (Password must be 8 to 127 characters)

**Example**

```
add snmp user v3 accessLevel readOnly auth MD5 encrypted no username john password abc12345
Success
```

```
add snmp trapServer v2cTrap ipAddress 192.168.0.231 community john
Success
```

**Related Commands**

*delete snmp*

*show snmp*
add zoneDisplay

Adds a display or video-wall to an existing zone.

Care should be taken that individual displays found within walls are not added to a Zone. This would result in the same display being in a zone more than once.

Syntax

add zoneDisplay name id

Parameters

name

Type: **STRING**

The name of the zone. Names are case-sensitive. ("All" is an option to add selected id to every current zone)

id

Type: **STRING or MAC Address**

The name or MAC address of the device. String names are case-sensitive.

Example

add zoneDisplay Zone1 Decoder5
Success

add zoneDisplay All Decoder2
Success

Related Commands

create zone
delete zone
delete zoneDisplay
show zones
channel

Will cycle through all encoders (of the same type as the decoder) that have a number (channel) suffix, "_nnn", where nnn is an integer (channel).

If there are encoders with names: enc_1, enc_100, enc_50, then a decoder will cycle through them in the order: enc_1, enc_50, enc_100, then back to enc_1.
If there are no encoders (of the same type as the decoder) with the channel suffix, an error is returned.

Only fastSwitch connection types is supported. If there was already a connection of some other type, it is changed to fastSwitched.

If the decoder has no connection, the encoder with the lowest channel suffix will be connected using fast-switch.

If the decoder has a connection to an encoder that does not have the channel suffix, then it will connect to the encoder that has the lowest channel suffix.

Note: In fastSwitch mode the join videoSource <decoder> command must be used to set audio to follow video join. Otherwise audio will not follow the video during channel up/down command.

Syntax

channel  direction  <decoder-id>

Parameters

direction
   Type:  STRING

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>up</td>
<td>cycle to next higher numbered encoder</td>
</tr>
<tr>
<td>down</td>
<td>cycle to next lower numbered encoder</td>
</tr>
</tbody>
</table>

decoder-id
   Type:  STRING or MAC Address

The name or MAC address of the decoder. String names are case-sensitive.

Example

channel  up  MyDecoder
Channel  changed to  Channel_2
Success

Related Commands

join videoSource
**clone multiview**

Used to create a copy of an existing multiview. *(ZyPer4K only)* Once created, the new multiview will be listed under the Multiview menu within the built-in ZMP.

Use the `set multiview` command to set a source encoder to a specified location and size within the multiview.

Refer to [Creating a Multiview Screen (page 41)] for information on managing multiview displays in the built-in ZMP.

**Syntax**

```
clone multiview name to newmvname
```

**Parameters**

- **name**
  
  Type: **STRING**
  
  The name of the existing multiview to be cloned. Names are case-sensitive.

- **newmvname**
  
  Type: **STRING**
  
  The name of the new multiview. The name of the multiview cannot exceed 255 characters in length. Names are case-sensitive.

**Example**

```
clone multiview mv2x2 to newmv2x2
Success
```

**Related Commands**

- `delete multiview`
- `delete multiviewWindow`
- `set multiview`
- `set multiview audioSource windowNumber`
- `show multiviews config`
- `show multiviews status`
create multiview

Creates an empty multiview display. (ZyPer4K only) Once created, the new multiview will be listed under the Multiview menu within the built-in ZMP.

Use the set multiview command to set a source encoder to a specified location and size within the multiview.

Refer to Creating a Multiview Screen (page 41) for information on managing multiview displays in the built-in ZMP.

Syntax

create multiview name

Parameters

name

Type: STRING

The name of the multiview. The name of the multiview cannot exceed 255 characters in length. Names are case-sensitive.

Example

create multiview myMultiview
Success

Related Commands

delete multiview
delete multiviewWindow
set multiview
set multiview audioSource windowNumber
show multiviews config
show multiviews status
**create presetNew**

Creates a new preset. Once created, the new preset will be listed under the **Preset** menu within the built-in ZMP.

**Syntax**

```plaintext
create presetNew name commands connections
```

**Parameters**

**name**

Type: **STRING**

The name of the preset. The name of the preset cannot exceed 250 characters in length. Names are case-sensitive.

**connections**

Type: **STRING**

Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>empty</td>
<td>This preset has no commands or connections associated with it.</td>
</tr>
<tr>
<td>existingConnections</td>
<td>Use the current connections to generate the preset</td>
</tr>
</tbody>
</table>

**Example**

```plaintext
create presetNew EveningShutDown commands existingConnections
Success
```

**Related Commands**

- create presetSchedule
- delete preset
- run preset
- set preset
- show preset
create presetSchedule

Inserts an existing preset into the schedule calendar. Once created, the item must be assigned months/days/time to execute. By default, without further setting, the preset will be schedule to occur every hour of every day.

Use the set preset zoneDisplay command to assign description, commands and schedule to the new schedule.

Syntax

create presetSchedule presetname schedule name

Parameters

presetname  
Type: STRING

The name of an existing preset.

name  
Type: STRING

The name of the schedule. The name of the schedule cannot exceed 250 characters in length. Names are case-sensitive.

Example

create presetSchedule EveningShutDown schedule GoHome
Success

Related Commands

create presetNew
delete preset
run preset
set preset
show preset
**create videoWall**

Creates an empty 2x2 video wall. Once created, the new video wall will be listed under the **Display Config** menu within the built-in ZMP.

Use the `join videoWall` command to assign a source encoder to the wall. To modify the size of the video wall and/or control bezel parameters, use the `set videoWall` command.

Refer to [Creating Video Walls](#) for information on managing video walls in the ZMP.

**Syntax**

`create videoWall name`

**Parameters**

`name`  
*Type: STRING*

The name of the video wall. The name of the video wall cannot exceed 255 characters in length. Names are case-sensitive.

**Example**

`create videoWall myWall`

**Success**

**Related Commands**

`delete videoWall`

`set videoWall`
create zone

Creates an empty zone. Once created, the new zone will be listed under the Zones menu within the built-in ZMP.

Use the add zoneDisplay command to assign decoders or video walls to the zone.

Syntax

create zone name

Parameters

name

Type: STRING

The name of the zone. The name of the zone cannot exceed 255 characters in length. Names are case-sensitive.

Example

create zone Zone1
Success

Related Commands

add zoneDisplay
delete zone
delete zoneDisplay
show zones
dataConnect

Connects two devices for IR or RS232 communication over a specified TCP port. **(Note)** TCP port only valid for connection between device and server. Not valid for connection between 2 devices.

The feature of dataConnect was added to allow a third party to connect to the ZMP server with a specific port and pass raw or telnet API commands (depending on the mode) to the server and port which is designated for a particular encoder or decoder.

**Syntax**

dataConnect id1 id2 mode tunnelPort port

**Parameters**

**id1**
Type: STRING
The name of the first device. String names are case-sensitive.

**id2**
Type: STRING
The name of the second device or server. String names are case-sensitive.

**mode**
Type: STRING
ir or rs232

**port**
Type: INTEGER
TCP-Port #. Integer range from 1,024 to 49,152

**Example**

dataConnect MediaPlayer server rs232 tunnelPort 2345
tunnel TCP port = 2345; telnet handshake mode
Success

**Related Commands**

show dataTunnels
set server dataTunnelMode
Notes on Tunnel Ports

There is a very convenient way to get RS232 data: TUNNELS.

Zyper$ dataConnect Decoder_1 server rs232
Dynamically assigned tunnel TCP port = 4100; telnet handshake mode
Success
Zyper$
Zyper$ show dataTunnels
data-sessions(d8:80:39:9b:9:a2);
   device: name=Decoder_1
   rs232Tunnel: port=4100
   rs232Tunnel-connections: none
Success
Zyper$

You can then connect to that tunnel port using TCP. Whatever is sent is forwarded to the
device. Whatever the device returns is received on that TCP connection.

In the easiest case, you can just use telnet to connect to the tunnel.

You can specify the port number as well:
Zyper$ dataConnect Decoder_1 server rs232 tunnelPort 4101
tunnel TCP port = 4101; telnet handshake mode
Success
Zyper$

You can set the default TCP connection mode: raw|telnet (defaults to telnet).

Zyper$ set server dataTunnelMode raw|telnet

When in telnet mode the IAC commands are sent/received. Although most telnet clients will
also work fine in raw mode.
delete allConfiguration

Deletes all device and server information from the Management Platform. The network configuration is preserved.

Syntax

delete allConfiguration action

Parameters

action

Type: STRING

Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reboot</td>
<td>Unit is automatically rebooted</td>
</tr>
<tr>
<td>restart</td>
<td>The ZyPer server service is restarted</td>
</tr>
<tr>
<td>shutdown</td>
<td>Unit is shutdown</td>
</tr>
</tbody>
</table>

Example

delete allConfiguration restart
delete allConfiguration reboot

Related Commands

factoryDefaults device
**delete device**

Deletes the specified device from the Management Platform database.

Note that if the deleted device remains on the network, then it will be rediscovered by the Management Platform and reposted to the database. To permanently remove a device from the database, physically disconnected it and execute the `delete device` command.

**Syntax**

```
delete device id
```

**Parameters**

`id`

*Type: STRING or MAC Address*

The name or MAC address of the device. String names are case-sensitive.

**Example**

```
delete device myDevice
Success

delete device 0:1e:c0:f6:42:a1
Success
```

**Related Commands**

`factoryDefaults device`
delete multiview

Deletes the specified multiview from the database on the Management Platform. (ZyPer4K family only)

Syntax

delete multiview name

Parameters

name
Type: STRING
The name of the multiview. Names are case-sensitive.

Example

delete multiview myMultiview
Success

Related Commands

create multiview
delete multiview Window
set multiview
set multiview audioSource windowNumber
show multiviews config
show multiviews status
delete multiviewWindow

Deletes the specified window from an existing multiview. *(ZyPer4K family only)*

Syntax

delete multiviewWindow name window arg

Parameters

name

Type: STRING

The name of the multiview. Names are case-sensitive.

arg

Type: INTEGER

Window number to remove. Integer range from 1 to 9

Example

delete multiviewWindow myMultiview window 5

Success

Related Commands

create multiview
delete multiview
set multiview
set decoder multiview audioSource windowNumber
show multiviews config
show multiviews status
**delete preset**

Deletes the specified preset, preset runlog or preset schedule from the system.

**Note:** Runlog is history of when the preset has been executed. Deleting the runlog does not impact the preset itself or the schedule.

**Syntax**

```
delete preset name
delete preset name runLog
delete preset name schedule schname
```

**Parameters**

- **name**
  
  Type: **STRING**

  The name of the preset. Names are case-sensitive.

- **schname**
  
  Type: **STRING**

  The name of the preset schedule. Names are case-sensitive.

**Examples**

```
delete preset lunch runLog
Success
```

```
delete preset lunch schedule eat
Success
```

**Related Commands**

- `create preset`
- `run preset`
- `set preset`
- `show preset`
**delete snmp**

Deletes an existing SNMP user or trap server. *(Please see Section 5 of this manual for additional details on SNMP support)*

**Syntax**

delete snmp arg name

**Parameters**

**arg**

Type: **STRING**

Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trapServer vc2Trap ipAddress</td>
<td>Delete trap server at the specified IP Address</td>
</tr>
<tr>
<td>&lt;address&gt; community &lt;comm&gt;</td>
<td>Delete SNMP user</td>
</tr>
<tr>
<td>user v2c</td>
<td>Delete SNMP user</td>
</tr>
<tr>
<td>user v3</td>
<td>Delete SNMP user</td>
</tr>
</tbody>
</table>

**name**

Type: **STRING**

IP address and community of trapserver or name of new SNMP user

**Example**

delete snmp trapServer v2cTrap 192.168.0.231 community john
Success

delete snmp user v3 username john
Success

**Related Commands**

* add snmp
* show snmp
**delete videoWall**

Deletes the specified video wall from the database on the Management Platform.

**Syntax**

```shell
delete videoWall name
```

**Parameters**

- **name**  
  *Type: STRING*  
  The name of the video wall. Names are case-sensitive.

**Example**

```bash
delete videoWall myWall
Success
```

**Related Commands**

- `create videoWall`
- `set videoWall`
**delete zone**

Deletes the specified zone from the database on the Management Platform.

**Syntax**

```
delete zone name
```

**Parameters**

*name*

Type: **STRING**

The name of the zone. Names are case-sensitive.

**Example**

```
delete zone zone1
Success
```

**Related Commands**

*add zoneDisplay*
*create zone*
*delete zoneDisplay*
*show zones*
delete zoneDisplay

Deletes the specified display from an existing zone.

Syntax

delete zoneDisplay name id

Parameters

name  
Type: STRING
The name of the zone. Names are case-sensitive.

id  
Type: STRING or MAC Address
The name or MAC address of the decoder/display. String names are case-sensitive.

Example

delete zoneDisplay myzone mydisplay1
Success

Related Commands

add zoneDisplay
create zone
delete zone
show zones
diagnostics device

Runs a set to test diagnostics on the specified device

Syntax

diagnostics device id

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the device. String names are case-sensitive.

Possible Results

Decoder/Encoder:

error, Device is down
warning, Device has no HDMI link
warning, Device rebooted %d times in the last minute
warning, Device rebooted %d times in the last hour
warning, Device rebooted %d times in the last day

Decoder:

error, HDMI Audio stream connection without video connection.
warning, HDCP is forced on, but may not be supported by display device (however it is unlikely)
error, Decoder has never received a valid EDID
warning, Decoder resolution exceeds display EDID maximum -- very likely this will not work
warning, Decoder using encoder resolution, which may not be display’s preferred based on its EDID
warning, Decoder using encoder resolution AND ignoring display EDID, which may allow resolution to exceed display capability
warning, Decoder using user-defined resolution, which may allow resolution to exceed display capability
error, Encoder down
warning, Encoder hdmi down
error, Encoder has multiview conflict with genlock
warning, Encoder stream disabled
warning, Video stream interrupted %d times in the last minute, indicating likely network problem
warning, Video stream interrupted %d times in the last hour, indicating likely network problem
warning, Video stream interrupted %d times in the last day, indicating possible network problem
warning, Encoder and decoder fps are not equal -- will result in very bad video
warning, Encoder and decoder fps are not equal -- will result in very bad video
warning, Encoder and decoder fps are not equal, but multiple of 2; this may still produce bad video
warning, Encoder and decoder HDCP versions are not the same
info, Encoder HDCP is disabled; this will prevent copyrighted material from display
info, Encoder HDCP is set to version 1.4; this may prevent copyrighted material from display

Encoder:

info, HDCP is disabled; this will prevent copyrighted material from display
info, HDCP is set to version 1.4; this may prevent copyrighted material from display
Examples

diagnostics device Top-Right
device(d8:80:39:9a:7f:ec);
   device.diags.summary; status=complete, error=0, warning=0, info=0
   Success

diagnostics device ABC
device(d8:80:39:9a:96:7);
   device.diags.info.1; message=HDCP is disabled; this will prevent copyrighted material from display
   device.diags.summary; status=complete, error=0, warning=0, info=1
   Success

diagnostics device encoder1
device(34:1b:22:80:26:2a);
   device.diags.warning.1; message=Device has no HDMI link
   device.diags.summary; status=complete, error=0, warning=1, info=0
   Success

diagnostics device MyEncoder
device(34:1b:22:80:63:9c);
   device.diags.error.1; message=Device is down
   device.diags.summary; status=complete, error=1, warning=0, info=0
   Success

diagnostics device MeetingRoom6
device(34:1b:22:80:57:7d);
   device.diags.error.1; message=Device is down
   device.diags.info.1; message=No video connection
   device.diags.warning.1; message=HDCP is forced on, but may not be supported by display device (however it is unlikely)
   device.diags.error.2; message=Decoder has never received a valid EDID
   device.diags.summary; status=complete, error=2, warning=1, info=1
   Success
**dumpusb**

Outputs details about USB devices found in ZyPerUHD and/or ZyPer4K units. Information includes MAC address and ICRON IP_address if ICRON USB found in ZyPer4K unit.

**Syntax**

dumpusb

**Example**

dumpusb

Encoders/Decoders usb reported mac

device UHDdec(UHDdec), usb mac 34:1b:22:80:57:df
device UHDenc2(UHDenc2), usb mac 34:1b:22:80:7f:3d
device Z4Kdec1(Z4Kdec1), usb mac 0:1b:13:1:1f:79
device Arts_Encoder_1(Arts_Encoder_1), usb mac 0:1b:13:1:1e:90

Icrons reported info

owner Arts_Encoder_1(80:1f:12:4d:9b:6b), deviceType local, icronMac 0:1b:13:1:1e:90, ipAddr 169.254.4.123, fwRev 1.9.4, pairedInfoRcvd yes, numPairedMacs 1, 0:1b:13:1:1e:90 Arts_Encoder_1(Arts_Encoder_1)

owner Z4Kdec1(Z4Kdec1)

Success

**Note:** This is a hidden command and will not appear in HELP
events

Causes the events mode to be entered.

Syntax

```
events
```

Server sends initial events and new events as they occur to the telnet session. Any character entered to the server causes the mode to exit back to the API prompt.

See Section 4 of this document for additional details on the events feature.
factoryDefaults device

Set the specified device to the factory-default settings.

Syntax

factoryDefaults device id

Parameters

id

Type: STRING or MAC Address

The name or MAC address of the device. String names are case-sensitive.

Example

factoryDefaults device Airshow
Success

factoryDefaults device 0:1e:c0:f6:a8:c3
Success

Related Commands

delete allConfiguration
**flashLeds**

Physically identifies the specified device on the network. When this command is executed, the fiber LED indicators on the device will flash for 5 seconds. *(ZyPer4K family only)*

**Syntax**

```
flashLeds id
```

**Parameters**

- **id**
  - **Type:** STRING or MAC Address
  - The name or MAC address of the device. String names are case-sensitive.

**Example**

```
flashLeds myEncoder
Success

flashLeds 0:1e:c0:f6:59:13
Success
```
join

Joins the specified decoder (display) with the specified encoder (source). The *mode* parameter must be specified and defines the type of join to execute.

▸ analogAudio
Embeds analog audio stream from the encoder on the output of the decoder. The audio is from the (analog) Audio jack on the encoder.
In order to control what type of audio is being output from the decoder, refer to the `set decoder AnalogAudioOut` command.

▸ fastSwitched
Allows the joining of an encoder and decoder with no video dropout. In order to make use of this feature, the resolution and frame rate of the “new” encoder must be the same as the previous encoder.

▸ genlocked
This mode provides a very low-latency, all-purpose method of joining an encoder and decoder. *(ZyPer4K family only)*

▸ genlockedScaled
This mode provides a very low-latency, all-purpose method of joining an encoder and decoder that includes scaling up or down at the decoder/display.

▸ hdmiAudio
Embeds hdmi-downmix audio from an encoder to specified decoder.

▸ multiview
Join the configured multiview to a display (decoder) *(ZyPer4K family only)*

▸ video
Joins video only from encoder to decoder. No audio.

▸ videoWall
Join the encoder to the named video-wall

▸ window
Join any portion of a source to any portion of a display

▸ usb
Creates USB connection between encoder and decoder. Note that multiple connections are valid.

▸ none
Special command to disconnect existing connections (joins)  Example: `join none decoder fastSwitched`

Syntax

```
join enc dec mode
join none dec fastSwitched
```
Parameters

**enc**
Type: **STRING** or **MAC Address**
The name or MAC address of the encoder. String names are case-sensitive.

**dec**
Type: **STRING** or **MAC Address**
The name or MAC address of the decoder. Can also be name of existing video-wall. String names are case-sensitive.

**zone**
Type: **STRING**
The name of an existing zone. String names are case-sensitive.

**mode**
Type: **STRING**
Supply one of the following arguments before executing this command.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analogAudio</td>
<td>Embed audio from the specified encoder</td>
</tr>
<tr>
<td>fastSwitched</td>
<td>Join in “fast-switched” mode</td>
</tr>
<tr>
<td>genlocked</td>
<td>Low-latency join mode (<a href="#">ZyPer4K family only</a>)</td>
</tr>
<tr>
<td>genlockedScaled</td>
<td>Low-latency with scale up/down (<a href="#">ZyPer4K family only</a>)</td>
</tr>
<tr>
<td>hdmiAudio</td>
<td>Join hdmi-audio to either hdmi-out or analog-out. Note this command will cause</td>
</tr>
<tr>
<td>multiview</td>
<td>Join a multiview to a display (<a href="#">ZyPer4K family only</a>)</td>
</tr>
<tr>
<td>videoWall</td>
<td>Join a source to a video-wall</td>
</tr>
<tr>
<td>video</td>
<td>Join video only (audio not joined)</td>
</tr>
<tr>
<td>window</td>
<td>Join any portion of a source to any portion of a display (<a href="#">ZyPer4k family only</a>)</td>
</tr>
<tr>
<td>usb</td>
<td>Establish USB connection</td>
</tr>
<tr>
<td>“none”</td>
<td>Disconnect existing joins</td>
</tr>
</tbody>
</table>

**Notes:**
Multiviews cannot be joined to a zone.
USB cannot be joined to a zone.
Examples

join myEncoder1 myDecoder2 fastSwitched
Success

join myEncoder1 myDecoder2 hdmi-audio
Success

join myMultiview2 Display4 multiview
Success

join myEncoder1 myWall videoWall
Success

join none myDecoder1 fastSwitched

Window Example

join myEncoder1 myDecoder2 window viewportSource 0 0 1920 1080
viewportDest 500 500 500 500

(ViewportSource parameters are starting X/Y coordinates of the source and desired X/Y size)

(ViewportDest parameters are starting X/Y coordinates in the display and desired X/Y size)
**join videoSource**

Tells a decoder to automatically join corresponding audio from a source encoder whenever a join command is used to join video.

**Syntax**

```
join videoSource dec mode
```

**Parameters**

- **dec**
  - Type: STRING or MAC Address
  - The name or MAC address of the decoder. String names are case-sensitive.

- **mode**

**Example**

```
join videoSource MyDecoder hdmiAudio
```

**Related Commands**

- `join hdmiAudio`
**load encoderEdid**

Uploads an EDID file to the specified encoder.

**Important Note:** Auto-EDID mode should be disabled when loading a specific EDID to an encoder. Otherwise the loaded EDID will immediately get replaced by the Auto-EDID option.

**Syntax**

`load encoderEdid enc mode file`

**Parameters**

`enc`

Type: **STRING** or **MAC Address**

The name or MAC address of the encoder. String names are case-sensitive.

`mode`

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>use whatever EDID information is provided by connected decoder</td>
</tr>
<tr>
<td>builtIn</td>
<td>use one of the EDID files provided by ZeeVee. Many options available covering various 4k settings. See list below.</td>
</tr>
<tr>
<td>default</td>
<td>use default EDID with maximum capabilities of the encoder</td>
</tr>
<tr>
<td>saved</td>
<td>use a file that user has previously saved to the system with the save device-edid command</td>
</tr>
</tbody>
</table>

`file`

Type: **STRING**

The name of the file to load.

load encoderEdid myEncoder builtIn zyper4k60
Success

Related Commands

save deviceEdid
set server autoEdidMode
**load idleImage**

Uploads an image to use at ZyPerUHD background when no video source streamed to the decoder.

**Syntax**

```
load idleImage dec filename file
```

**Parameters**

- **dec**
  - **Type:** STRING or MAC Address
  - The name or MAC address of the decoder. String names are case-sensitive.

- **file**
  - **Type:** STRING
  - The name of the file to load. (Must already exist on ZMP in Files directory)

**Examples**

```
load idleImage myDecoder filename background.jpg
```

**Success**

**Notes:**

- Image must be in .JPG format
- Image must be 1280 x 720 in size
  (Will output from decoder at this resolution)

- Image file must be previously copied onto ZMP into the Files directory using FTP. Alternately file can be loaded via the GUI. See Display Grid “Config” tab.

**Related Commands**

- **set decoder osdStatusMode**
logging

Used to set the level of detail captured by Trouble Reports and manually add text notes into log for Trouble report. To be used at direction of ZeeVee support team to aid in troubleshooting of issues.

Syntax

logging level arg

Parameters

arg

Type: INTEGER

Logging Level. Integer range from 1 to 4

Example

logging level 2
Success

Syntax

logging note string

Parameters

string

Type: text

String with length from 1 to 132 characters

Example

logging note “my inserted text”
Success
previewStream

Used to turn on/off a small thumbnail size preview stream that is viewable in the ZyPer Management Platform GUI. (ZyPer4K and ZyPerUHD only)  **Note:** Preview streams are not supported by the ZyPer4K-XS and ZyPer4K-XR

Syntax

previewStream enc arg comp width size

Parameters

enc

Type: **STRING** or **MAC Address**

The name or MAC address of the encoder. String names are case-sensitive.

arg

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stop</td>
<td>used to manually stop the preview stream. Note that it can turned back on from the GUI</td>
</tr>
<tr>
<td>start</td>
<td>used to manually start the preview stream.</td>
</tr>
</tbody>
</table>

comp

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hls</td>
<td>set the format of the preview stream to HLS</td>
</tr>
<tr>
<td>jpeg</td>
<td>set the format of the preview stream images to JPEG</td>
</tr>
</tbody>
</table>

size

Type: **Integer**

Width of the preview stream in pixels. (180 to 400)
Example

previewStream MyEnc start hls width 300
BWG: After Start Preview Streams running = 3
Success

previewStream MyEnc stop
Success

HLS Notes

A maximum of 20 preview streams may be enabled at a single time.

ZyPer4K devices must be on firmware release 4.0.1.0 or newer for this feature to work.

The HLS stream can be viewed by any HLS capable viewer such as a browser. The path needed is shown below:

http://mp_ip_address/media/encoder_mac_address.m3u8

mp_ip_address is the IP address of the ZyPer Management Platform
encoder_mac_address is the MAC address of the Z4K encoder

Example

http://192.168.0.78/media/d8:80:39:eb:1c:ee.m3u8

JPEG Notes

JPEG images cannot be viewed in the ZyPer Management Platform GUI. This feature is intended for 3rd party control systems to grab individual JPEG images. (1 per second)

The JPEG images can be viewed by any JPEG capable viewer such as a browser. They can also be directly downloaded to a system. The path needed is shown below:

http://mp_ip_address/media/encoder_mac_address.jpeg

mp_ip_address is the IP address of the ZyPer Management Platform
encoder_mac_address is the MAC address of the Z4K encoder

Examples

http://192.168.0.78/media/d8:80:39:eb:1c:ee.jpeg

**redundancy switchover**

If there is an active slave, this command causes the existing master to become the slave and the existing slave to become the master. The server does not restart or re-initialize any other state, including any existing video and audio connections.

The IP address that is always assigned to the master. If the active slave becomes the master, this IP address will then terminate at that system. Note that any existing TCP connection will terminate and have to be reopened (to the new master).

**Syntax**

```plaintext
redundancy switchover
```

**Parameters**

```plaintext
none
```

**Example**

```plaintext
redundancy switchover
Success
```

**Related Commands**

```plaintext
set server redundancy
redundancy delete downServers
```
**redundancy delete downServers**

Cleans up and removes any redundant servers from server list that are no longer available in the system.

**Syntax**

```
redundancy delete downServers
```

**Parameters**

`none`

**Example**

```
redundancy delete downServers
Success
```

**Related Commands**

- `set server redundancy`
- `redundancy switchover`
**restart device**

Restarts the specified device.

**Syntax**

```
restart device id
```

**Parameters**

- **id**
  
  **Type:** STRING or MAC Address
  
  The name or MAC address of the device. String names are case-sensitive.

**Example**

```
restart device myEncoder2
Success

restart device 0:1e:c0:f6:cb:76
Success
```

**Related Commands**

- **restart server**
**restart server**

Restarts the server. Linux is not restarted.

**Syntax**

`restart server`

**Parameters**

`none`

**Example**

`restart server`

*Success*

**Related Commands**

`restart device`
**restore server database**

Restores a stored server database from file. (Stored on the ZyPerMP hardware)

**Important Note:** Saved database to be restored MUST have been created using the exact same version of API that is currently running.

**Syntax**

```
restore server database name
```

**Parameters**

`name`  
Type: **STRING**  
The name of the stored database. Names are case-sensitive.

**Example**

```
restore server database jan16_2019
Loaded database jan16_2019; restarting server
Success
```

**Related Commands**

`save server database`
revert server

Returns to a previously installed version of the API and device database.

This feature can be used to go back to a previous software version and database version in case of a failed software upgrade. Primarily used to recover previous state if something goes wrong.

Syntax

revert server

Note: The show server info command will identify the Previous Version that will be restored to the system.

Example

revert server
Reverting from update_nuc_1.8.34605.zyper to update_nuc_2.0.34928.zyper
Success

Related Commands

show server info
run preset

Manually executes an existing preset

Syntax

run preset name

Parameters

name  
Type: STRING

The name of the existing preset. Names are case-sensitive.

Example

run preset lunch
Success

run preset closing
Success

Related Commands

create preset
delete preset
set preset
show preset
**save deviceEdid**

Saves the EDID of the downstream sink to the `srv/ftp/files` folder on the Management Server. Executing this command will generate two file types: `.bin` and `.txt`. The `.bin` file is the EDID in standard format. The `.txt` file is the decoded EDID data. See Using Custom EDID Data (page 79) for more information on using this command.

**Syntax**

```
save deviceEdid id file
```

**Parameters**

*id*

Type: **STRING or MAC Address**

The name or MAC address of the decoder that is connected to the sink device. String names are case-sensitive.

*file*

Type: **STRING**

The name of the EDID file. Two files will be created using the `file` name: `.txt` and a file with no extension.

**Example**

```
save deviceEdid 0:1:e:c0:f6:a5:2f myEDID
```

Success

**Related Commands**

- `load encoderEdid`
- `set server autoEdidMode`
save server database

Saves the current MP database to a file. (Stored on the ZyPerMP hardware)

Syntax

save server database name

Parameters

name  Type: STRING

The name of the database. Names are case-sensitive.

Example

save server database jan16_2019
Saved database to jan16_2019
Success

Related Commands

restore server database
save system config

Saves the current system configuration to a file. (Stored on the ZyPerMP hardware)

Syntax

```
save system config name
```

Parameters

- **name**
  - Type: STRING
  - The name of the file. Names are case-sensitive.

Example

```
save system config march24
Saved config to /srv/ftp/files/march24
Success
```

Related Commands

- save server database
- restore server database
script

Executes the specified script. The script must exist in the /srv/ftp/files folder. Use the optional loop argument to place the script in a loop. The script will continue running until a key is pressed on the keyboard.

Syntax

```
script file [loop]
```

Parameters

**file**

Type: **STRING**

The name of the script file.

Example

```
script myScript
Success
```

Related Commands

**sleep**
**send**

Sends an IR, RS232 or CEC string to the specified device. Use the `type` parameter to specify an IR, RS232 or CEC code.

**Syntax**

`send id type text`

**Parameters**

**id**

Type: **STRING or MAC Address**

The name or MAC address of the device.

**type**

Type: **STRING**

Specifies IR, CEC or RS232 command

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ir</code></td>
<td>The string must be the hex representation of the binary data. (Pronto code)</td>
</tr>
<tr>
<td></td>
<td>The maximum length for a string is 1024 characters. (Not supported on ZyPerUHD)</td>
</tr>
<tr>
<td><code>cec</code></td>
<td>on</td>
</tr>
<tr>
<td><code>cec</code></td>
<td>hexString</td>
</tr>
<tr>
<td><code>rs232</code></td>
<td>The string is ASCII and must not exceed 256 characters in length. Spaces and</td>
</tr>
<tr>
<td></td>
<td>the following control characters are supported as a portion of the string:</td>
</tr>
<tr>
<td><code>\n</code></td>
<td>New line</td>
</tr>
<tr>
<td><code>\r</code></td>
<td>Carriage return</td>
</tr>
<tr>
<td><code>\t</code></td>
<td>Tab</td>
</tr>
<tr>
<td><code>\</code></td>
<td>Slash</td>
</tr>
<tr>
<td><code>\xnn</code></td>
<td>Hex value, where nn is a two-digit hex value, including leading zeros</td>
</tr>
</tbody>
</table>

**text**

Type: **STRING**

The string to send. See the table, above, for restrictions.
Example

send myDecoder2 ir 000000690000015005f001700300017003000170030001700300017003000170030001700170017001700170017003000170017001700170017001700170030001700300017003000200
Success

send myDecoder2 rs232 ZeeVee_support_is_the_greatest\r\nSuccess

send myDecoder2 cec on
Success

send myDecoder2 cec off
Success

Important Notes

CEC is not supported on ZyPerHD

CEC functionality on the ZyPer4K is only supported with hardware firmware version 3.5.2 and newer.

CEC hexString command is not supported on ZyPerUHD

Related Commands

set device rs232
set encoder analogAudioOut

Sets the analog audio output source type for the specified encoder. (ZyPer4K family only)

Syntax

```
set encoder id mode type
```

Parameters

**id**

Type: STRING or MAC Address

The name or MAC address of the encoder. String names are case-sensitive.

**mode**

Type: STRING

The audio output to use.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analogAudioOut</td>
<td>Audio output from the Audio port on the Encoder.</td>
</tr>
</tbody>
</table>

**type**

Type: STRING

The audio mode (analog or HDMI).

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source none</td>
<td>No analog audio output from the encoder</td>
</tr>
<tr>
<td>source hdmiAudioDownmix</td>
<td>Uses downmixed audio from input HDMI stream.</td>
</tr>
</tbody>
</table>

Example

```
set encoder Myencoder1 analogAudioOut source hdmiAudioDownmix
Success
```
Detailed Background

ZeeVee added a feature that will allow compressed formats to be passed down in an encoder EDID file. This EDID will be then forwarded to the source device to determine the type of audio sent to the encoder.

This enhancement was to provide fast-switched connections the “compressed audio” options in the EDID file. Prior to this version with the fast-switched connection, ZeeVee modified the EDID passed from the decoder to the encoder and removed all compression formats. This left just LPCM as the only option under the “Audio data block” in the edid file.

>>> Audio data block <<<
  Linear PCM, max channels 8
  Supported sample rates (kHz): 192 176.4 96 88.2 48 44.1 32
  Supported sample sizes (bits): 24 20 16

The information provided to the Video Source device (such as BluRay Player or Media player) increases the possibility of compression being a chosen audio format. However it is still up to the device to choose uncompressed or compressed formats. It is important to know that some devices such as the Apple 4K TV requires the audio output type to be set (even if the audio format is available in the EDID). Compression will need to be set manually on these types of devices.

In addition any downmixed stream internal to ZyPer devices will not process compressed audio, so you will not hear compressed audio on these connections.

Syntax

```
set encoder id edid audio mode
```

Parameters

`id`

**Type:** STRING or MAC Address

The name or MAC address of the encoder. String names are case-sensitive.
mode

Type: **STRING**

The supported input audio mode

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>onlyPcm</td>
<td>Force PCM audio format at encoder. Does not allow compressed formats such as AC3.</td>
</tr>
<tr>
<td>allowCompressed</td>
<td>Passes the decoders edid with unmodified audio information and thus allows compression options to be seen.</td>
</tr>
<tr>
<td>serverDefault</td>
<td>Follows the server setting</td>
</tr>
</tbody>
</table>

**Example**

set encoder Cuba edid audio allowCompressed
Success

**Related Commands**

set server encoderDefaultAudioFormat

**Additional Information**

In an attempt to properly identify the Audio Streams used under the product the following changes were also made along with some modification to the API commands.

<table>
<thead>
<tr>
<th>Product</th>
<th>Old Audio Stream Name</th>
<th>New Stream Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZyPer4K</td>
<td>hdmi (used in genlocked mode)</td>
<td>hdmiPassthroughAudio</td>
</tr>
<tr>
<td>ZyPer4K</td>
<td>hdmi-audio-downmix</td>
<td>hdmiAudio</td>
</tr>
<tr>
<td>ZyPer4K</td>
<td>analog-audio</td>
<td>analogAudio</td>
</tr>
<tr>
<td>ZyPerUHD</td>
<td>audio</td>
<td>hdmiAudio</td>
</tr>
<tr>
<td>ZyPerUHD</td>
<td>analog-audio</td>
<td>analogAudio</td>
</tr>
<tr>
<td>ZyPerHD</td>
<td>Part of fast-switched connection</td>
<td>No Change</td>
</tr>
<tr>
<td>ZyPerHD</td>
<td>Part of fast-switched connection</td>
<td>No Change</td>
</tr>
</tbody>
</table>
The ZyPer4k can have analog and digital audio streams going to the decoder at the same time and routing either way.

So:

```
join <enc> <dec> hdmiAudio
```

is simply used to route ‘standard’ HDMI audio from encoder to decoder.

Which port it goes out is based on defaults or the set command.

```
Zyper$ set decoder z4k_dec_desk_58 analogAudioOut source
  analogAudio
  hdmiAudioDownmix

or

Zyper$ set decoder z4k_dec_desk_58 hdmiAudioOut source
  analogAudio
  hdmiAudio (For HDMI out only)
  hdmiAudioDownmix
  hdmiPassthroughAudio (This is for genlockonly)
```
**set encoder hdcpMode**

Sets the hdcp mode for the specified encoder.

**Syntax**

`set encoder id mode type`

**Parameters**

*id*

Type: **STRING or MAC Address**

The name or MAC address of the encoder. String names are case-sensitive.

*mode*

Type: **STRING**

The hdcp mode to use

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hdcpMode</td>
<td>HDCP mode of the Encoder.</td>
</tr>
</tbody>
</table>

*type*

Type: **STRING**

Enable or Disable

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>encoder will accept HDCP 1.4/2.2 compatible streams. Also will accept unencrypted inputs.</td>
</tr>
<tr>
<td>enabled1_4</td>
<td>encoder will accept HDCP 1.4 compatible streams. Also will accept unencrypted inputs.</td>
</tr>
<tr>
<td>disabled</td>
<td>encoder will reject HDCP 1.4/2.2 compatible streams. Will only accept unencrypted inputs.</td>
</tr>
</tbody>
</table>

**Example**

```
set encoder Myencoder1 hdcpMode disabled
```

**Success**

**Notes**

Useful when user does not want Source such as Apple Macbook to provide HDCP protected content to the Encoder.
**set decoder**

Sets the audio output type and video timing details for the specified decoder.

**Syntax**

```
set decoder id mode type
```

**Parameters**

**id**

*Type: STRING or MAC Address*

The name or MAC address of the decoder. String names are case-sensitive.

**mode**

*Type: STRING*

**argument**

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>fps</td>
<td>Frames per second</td>
</tr>
<tr>
<td>source</td>
<td>Match decoder resolution to source input size</td>
</tr>
<tr>
<td>auto</td>
<td>automatically based on EDID</td>
</tr>
</tbody>
</table>

**Command Description:** Override output display size and fps

```
set decoder <Decoder_Name or MAC> displayResolution activeSize <int> pixelsHoriz <int> pixelsVert <int> fps <int>|source
```

This command allows an override of EDID parameters supplied by the display. Regardless of what the supplied EDID indicates, the decoder will generate a stream with specified overall size and frame rate parameters.

Note that in “genlock-scaled” mode, the frame rate parameter is ignored – it must be the same as the encoder frame rate. This does mean care must be taken when setting this parameter if the source stream is 60fps (e.g. 720p60fps) and scaled to 4K. That only works if the display supports 4K60.
If configured resolution specification in these parameters that exceed the displayed maximum resolution, the display will black out with no indication to the user.

Example command:
Zyper$ set decoder Dec1 displayResolution activeSize 3840 2160 fps 60

**Command Description:** Output display size determined by received EDID

**Command Syntax**
set decoder <Decoder_Name or MAC> displayResolution auto

The command causes the decoder to set output display size to the “preferred” value in the EDID received from the display.

**Command Description:** Override detailed video parameters

**Command Syntax**
set decoder <decoderMac|decoderName> displayAdvancedTiming activeSize <pixelsHoriz:int> <pixelsVert:int> fps <float> total-size <pixelsHoriz:int> <pixelsVert:int> syncFrontPorch <pixelsHoriz:int> <pixelsVert:int> syncWidth <pixelsHoriz:int> <pixelsVert:int> syncPolarity hPositive|hNegative vPositive|vNegative

This command allows an override of EDID parameters supplied by the display. Regardless of what the supplied EDID indicates, the decoder will generate a stream with specified detailed timing parameters.

If configured resolution specification in these parameters that exceed the displayed maximum resolution, the display will black out with no indication to the user.

Example command:
Zyper$ set decoder Dec1 displayAdvancedTiming activeSize 1920 1080 fps 60 totalSize 2200 1200 syncFrontPorch 88 4 syncWidth 44 5 syncPolarity hPositive vPositive
**set decoder edidPreferMode**

Sets the preferred resolution from the display EDID

**Syntax**

```
set decoder id mode type
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

**mode**

Type: **STRING**

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edidPreferMode</td>
<td>Select preferred EDID mode</td>
</tr>
</tbody>
</table>

**type**

Type: **STRING**

HDCP options. (Note: Valid with ZyPerUHD only) Used to minimize connection time.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| max      | Default mode. Selects the largest resolution defined in the EDID.
| strict   | Selects the Preferred resolution as stated in the display EDID   |

**“max”** – Default mode. Selects the largest resolution defined in the EDID. This has been the operating mode prior to this command. In almost all cases, this is the native resolution of the display. However, some displays can accept a resolution above the native (and scale down). In this case, it is better to use the “strict” mode.

**“strict”** – The Preferred Resolution is selected as defined in the EDID 1.3 specification. EDID 1.3 specifies that the first Detailed Timing Descriptor in the Standard Timing Information block is always the preferred resolution, although it is only the native resolution if the native-resolution flag is set. If the native-resolution flag is not set, then the maximum resolution will be chosen (falls back to “max” mode).
Note: All comparisons of “resolution” actually mean comparisons of the associated Pixel Clock. The Pixel Clock represents the entire resolution definition: horizontal and vertical size, fps, bit-depth and color decimation (RGB/4:4:4, 4:2:2, 4:2:0).

The command will immediately reanalyze the active EDID and if needed change the preferred resolution and reconnect to the encoder.

The reason for the “max” mode, and for it being the default, is that many displays do not follow the EDID 1.3 specification, claiming a native, Preferred Resolution below the display’s actual native resolution. It is fairly common for a UHD display to have an HD resolution as the specified preferred resolution.

Note: ZyPer4K and ZyPerUHD, depending on mode, may support only a limited set of output resolutions, particularly when the scaler is enabled. ZMP will choose the active resolution based decoder capability, scaler mode and preferred resolution. However, the display’s Preferred Resolution is displayed regardless of what the decoder ultimate actually uses. The active resolution is displayed in the decoder status as well.

Overriding Preferred Resolution Selection

It should rarely be required. But if the EDID supplied by the display is not correct, or for some reason ZMP chooses a Preferred Resolution that is not desired, the following command will force the decoder to a specific output resolution:

```
set decoder <decoder> displayResolution activeSize <int> <int> fps <float>
```

When set, the decoder output resolution will remain as specified without exception.

Note: When in this mode, it is very possible that no video will be displayed, and with no warning from ZMP. It is up to the user to ensure that the output settings are valid for the display.
Scaler Control

ZyPer4K “HDMI 2.0” and ZyPerUHD decoders have output scaling. Besides the obvious benefit of supporting HD-only displays with a UHD source, the other major benefit is faster switching times. With ZyPer4K, there is virtually no delay. With ZyPerUHD it is less than a one second.

However, there are some cases where disabling the scaler produces a better image. Of course, if the scaler is disabled and the source provides a resolution greater than the display’s ability, it will be black. To solve this problem, we have a new mode that disables the scaler, but only if the display can handle the source resolution.

The decoder display-resolution command now has an option called “source”.

```
set decoder <decoder> display-resolution source
```

When in “source” mode the scaler is disabled if the display can handle the received resolution. Otherwise it is automatically enabled (e.g. if the source is 480 and the Preferred Resolution is 1080 then the scaler is disabled, but if source is UHD and the Preferred Resolution is 1080, then the scaler is enabled).

The downside to this mode: switching time between non-scaled resolutions is about 3 seconds. Switching time between scaled and non-scaled resolutions is closer to 4s.

Active Output Resolution Selection

Selecting the correct output resolution for a decoder is, unfortunately, a fairly complicated endeavor. Clearly depends on the display (Preferred Resolution), but also on the decoder capability and the source resolution.

Remember: All comparisons of “resolution” actually mean comparisons of the associated Pixel Clock. The Pixel Clock represents the entire resolution definition: horizontal and vertical size, fps, bit-depth and color decimation (RGB/4:4:4, 4:2:2, 4:2:0).

Also, setting “edidPreferMode” only affects which Preferred Resolution is chosen. It does not affect when that Preferred Resolution is used (or if it is used). Although the chosen Preferred Resolution is always reported in the decoder status output (as is the chosen active output resolution).
ZyPer4K HDMI 1.4 Devices

No scaler, effectively always in “displayResolution source” mode. Source is always sent to output. If output can’t handle source, there will be no video.

Decoder Preferred Resolution is only status; it is never used to affect the decoder output resolution. Decoder “displayResolution” overrides are ignored.

ZyPer4K HDMI 2.0 Devices

Presently, the decoder active resolution is limited to a number of resolutions: 4096x2160, 3840x2160, 1080x1920 or 1280x720. The closest lower resolution is used.

There are a number of exceptions to the operation.
• Scaler always converts to 8bit 444/RGB. That means UHDp60 4:2:0 is converted to UHDp60 4:4:4. UHDp60 YUV 4:2:0 bit rate is lower than HDMI 1.4. But UHDp60 4:4:4 is not. In this case, the output FPS is divided by 2.
• If in genlockScaled, videoWall or window mode, decoder FPS must equal encoder FPS
  o Means 1080p60 scaling to UHD must be UHDp60, which won’t work if display is only UHDp30 capable.
  o If UHDp60 > decoder Preferred Resolution, then the output is left at 1080p60.
• If source is 1080i
  o Output must be input FPS * 2
  o If decoder resolution > 1080, it is set to 1080.

displayResolution = auto
When in this mode, the output resolution will always be the Preferred Resolution. There really is no reason not to use this mode with the Z4K Charlie and will produce the lowest switching times.

displayResolution = source
When in this mode, the output resolution will always be the encoder resolution, unless the source resolution greater than the encoder resolution (same case as displayResolution auto).

This mode may provide better video at or below the preferred resolution of the display. However, the switching time is somewhat slower (~3.3s).

displayResolution = sourceIgnoreEdid
Same operation as displayResolution = auto, but effectively using a manually entered Preferred Resolution. Generally only used if the EDID is incorrect.
ZyPerUHD

The ZyPerUHD scaler scales up fine (source resolution lower than display preferred). However, it can only scale down from UHD to 1080.

Even with this limitation, the vast majority of installations will be fine. The exception comes with PC-based resolutions. For example a case that will not work well:
• 1080-only display and source resolution of 1920x1200

For the cases where VESA/PC resolutions such as 1920x1200, 2560x1440 and 2560x1600 are needed, all displays must be at least that resolution or greater. For example, a 1920x1200 display can handle all resolutions up to 1920x1200 and it can also handle UHD, since the decoder will output UHD scaled down to 1080 (which is fine for a 1920x1200 display).

And, clearly, all of those resolutions will be fine if the displays are UHD capable (scaling up works, plus, the new mode ”display-size source” can be used).

If a configuration that causes downscaling that is not handled well, likely generating poor video, a warning will be generated.

**displayResolution = auto**

When in this mode, the output resolution will always be the **Preferred Resolution**, unless the source resolution greater than the preferred resolution.

This mode provides the fastest switching time (less than 1 second). However, there may be some cases where video quality is less than when using display-resolution = source.

If source is greater than decoder Preferred Resolution, then decoder output will be **1920x1080** (unless the display does not support it) with the preferred FPS. As noted, the only case this normally works for is when the source is 3840x2160.

**displayResolution = source**

When in this mode, the output resolution will always be the **encoder resolution**, unless the source resolution greater than the encoder resolution (same case as displaySize auto).

This mode may provide better video at or below the preferred resolution of the display. However, the switching time is somewhat slower (~3.3s).

**displayResolution = sourceIgnoreEdid**

Same operation as displayResolution = auto, but effectively using a manually entered Preferred Resolution. Generally only used if the EDID is incorrect.
**set decoder hdmi5vControl**

Enables or disables 5V HDMI line of the decoder. *(ZyPer4K-XS and ZyPer4K-XR only)*

When decoder is not receiving a video stream the decoder will disable the 5V HDMI line.

**Syntax**

```
set decoder id hdmi5vControl arg
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

**arg**

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>5V HDMI line will disable when no video streamed on the decoder.</td>
</tr>
<tr>
<td>disabled</td>
<td>5V HDMI line is never disabled. <em>(Default)</em></td>
</tr>
</tbody>
</table>

**Example**

```
set decoder myDecoder hdmi5vControl enabled
```

Success

If you attempt to run this command on a decoder that is not XS/XR or not on correct firmware you get the following error.

```
Error:(29) Device myDecoder does not support or cannot change: videoPort with value hdmi5vControl.
```

**Notes**

ZyPer4K-XS or ZyPer4K-XR must be updated to firmware version 1.3.2.4 or newer for this command to work.

The connection before disconnecting video from the decoder must be “genlocked” to fully disable video and cut the 5V line.
**set decoder osdStatusMode**

Enables or disables on-screen-display feature of the decoder. *(ZyPerUHD only)*

When decoder is not receiving a stream the decoder will display a "No Source Found" screen. In the lower corner of this screen is displayed the following information:

- Firmware version and date
- IP address of the decoder
- Remote IP: (Encoder it is attempting to get stream from if any)
- MAC Address

The osdStatusMode command will make this information visible or not. Note, changing status with the command will force the decoder to reboot.

**Syntax**

```bash
set decoder id osdStatusMode arg
```

**Parameters**

`id`

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

`arg`

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>OSD feature enabled.</td>
</tr>
<tr>
<td>disabled</td>
<td>OSD feature disabled.</td>
</tr>
</tbody>
</table>

**Example**

```bash
set decoder myDecoder osdStatusMode enabled
```

*Warning:* *(36) Device myDecoder has been restarted*

*Success*
**set decoder powerSave**

Enables or disables power save feature of the decoder. *(ZyPerUHD only)*

When decoder is not receiving a stream the decoder will enter a low power mode and the display will go black.

**Syntax**

```
set decoder id powerSave arg
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

**arg**

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Power save feature enabled.</td>
</tr>
<tr>
<td>disabled</td>
<td>Power save feature disabled.</td>
</tr>
</tbody>
</table>

**Example**

```
set decoder myDecoder powerSave enabled
Success
```
**set device general name**

Sets the name for the specified encoder or decoder.

**Syntax**

```
set device id general name str
```

**Parameters**

- **id**
  
  **Type:** STRING or MAC Address

  The name or MAC address of the device. String names are case-sensitive.

- **str**

  **Type:** STRING

  The name for the device.

**Example**

```
set device myDecoder5 general name Samsung-55
Success
```

**Related Commands**

- set device ip static
- set device rs232
- set device sourceDisplay iconImageName
- set device sourceDisplay location
- set device sourceDisplay manufacturer
- set device sourceDisplay model
- set device sourceDisplay serialNumber
**set device ip**
Sets DHCP mode for the specified device.

**Syntax**

```plaintext
set device id ip arg
```

**Parameters**

*id*

Type: **STRING** or **MAC Address**

The name or MAC address of the decoder.  String names are case-sensitive.

*arg*

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dhcp</td>
<td>IP address assigned by DHCP server</td>
</tr>
<tr>
<td>linkLocal</td>
<td>IP address self assigned Link-Local</td>
</tr>
</tbody>
</table>

**Example**

```plaintext
set device ABC ip dhcp
Success
```

**Related Commands**

- `set device sourceDisplay manufacturer`
- `set device sourceDisplay model`
- `set device sourceDisplay serialNumber`
set device ip static

Sets static mode for the specified device. The IP address, subnet mask, and gateway must be supplied.

Syntax

\texttt{set device id ip static addr mask gatew}

Parameters

\texttt{id}  
Type: \texttt{STRING or MAC Address}  
The name or MAC address of the decoder. String names are case-sensitive.

\texttt{addr}  
Type: \texttt{IP Address}  
The desired IP address for the device.

\texttt{mask}  
Type: \texttt{IP Address}  
The desired subnet mask for the device.

\texttt{gatew}  
Type: \texttt{IP Address}  
The desired gateway for the device.

Example

\texttt{set device ABC ip static 10.5.68.121 255.255.255.0 10.5.64.1}  
\texttt{Success}

set device irProcessing

Configures ZyPer4K endpoint to process input IR commands to issue *channel up or channel down* API command.

ZyPer Remote is an IR remote control. Part number: ZVREMOTE
Hitting Up or CH+ button will issue *channel up* API command.
Hitting Down or CH- button will issue *channel down* API command.

ZeeVee IR Receiver is required to be plugged into Decoder IR input port.
Part number: Z4KIRRX

ZyPer Trigger is a device to connect a “button” to the ZeeVee decoder IR ports.
Part number: Z4KIRTRIGTX

**Syntax**

```
set device id irProcessing arg
```

**Parameters**

`id`

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive.

`arg`

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>zyperTrigger</td>
<td>Process button press from ZyPer Trigger device</td>
</tr>
<tr>
<td>zyperRemote</td>
<td>Process up/down button press from ZeeVee IR remote control</td>
</tr>
<tr>
<td>none</td>
<td>Do not process IR inputs</td>
</tr>
</tbody>
</table>

**Example**

```
set device Z4KDec irProcessing zyperRemote
```

Success

**Related Commands**

```
set device general name
set device ip static
```
**set device rs232**

Sets the RS232 settings for the specified device.

**Syntax**

```plaintext
set device id rs232 baud data stop parity
```

**Parameters**

**id**  
Type: **STRING or MAC Address**  
The name or MAC address of the device. String names are case-sensitive.

**baud**  
Type: **INTEGER**  
The baud rate for the device. Supply one of the following values from the table below.

<table>
<thead>
<tr>
<th>argument</th>
<th>2400</th>
<th>9600</th>
<th>19200</th>
</tr>
</thead>
<tbody>
<tr>

**set device sendIpMcastRange**

Sets allowable range of multicast addresses for selected devices. *(ZyPer4K family only)*

**Syntax**

```
set device id sendIpMcastRange first:ip last:ip
```

**Parameters**

**id**

*Type: STRING or MAC Address*

The name or MAC address of the encoder. String names are case-sensitive. Can all use "all" or "encoders" as an ID option.

**first:ip / last:ip**

*Type: Multicast Address*

Supply the starting and ending multicast addresses in the allowable range.

**Note:** Allowable range is from 224.1.1.1 to 239.255.255.255

**Example**

```
set device encoders sendIpMcastRange 224.1.1.25 224.1.2.125
```

**set device sourceDisplay iconImageName**

Assigns an icon to the desired device. The icon will be displayed within the ZMP to identify the device.

**Syntax**

```
set device id sourceDisplay iconImageName fname
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The name or MAC address of the encoder or decoder. String names are case-sensitive.

**fname**

Type: **FILENAME**

The full filename of the icon to be used. The filename is case-sensitive.

set device sourceDisplay location

Assigns a location description for the specified device.

Syntax

set device id sourceDisplay location loc

Parameters

id
  Type: STRING or MAC Address
  The name or MAC address of the device. String names are case-sensitive.

loc
  Type: STRING
  The location description of the device (e.g. “Conference_Rm”, “Den”, etc.). Do not use quotes when specifying this string value.

Example

set device myDecoder3 sourceDisplay location VideoWall-1
Success

set multiview

Assigns source to a position and size within a multiview display. *(ZyPer4K family only)*

**Syntax**

```
set multiview id windowNumber wn encoderName enc position
percentPositionX posx percentPositionY posy percentSizeX sx
percentSizeY sy layer ly
```

```
set multiview id windowNumber wn encoderName enc position
pixelPositionX posx pixelPositionY posy pixelSizeX sx pixelSizeY sy
layer ly
```

**Parameters**

**id**

Type: **STRING**

Name of previously created multiview. String names are case-sensitive.

**wn**

Type: **Integer**

Window number within the multiview (1-19)

**enc**

Type: **STRING or MAC Address**

The name or MAC address of the encoder. String names are case-sensitive.

**percentPositionX**

Type: **Integer**

X coordinate in percentage of multiview canvas. Upper left corner of window. (0-99)

**percentPositionY**

Type: **Integer**

Y coordinate in percentage of multiview canvas. Upper left corner of window. (0-99)

**pixelPositionX**

Type: **Integer**

X coordinate of multiview in multiview canvas. Upper left corner of window.

**pixelPositionY**

Type: **Integer**

Y coordinate of multiview in multiview canvas. Upper left corner of window.
pixelSizeX

Type: Integer

Size/Length of multiview window. Number of pixels in multiview canvas.

pixelSizeY

Type: Integer

Size/Height of multiview window. Number of Pixels in multiview canvas.

percentSizeX

Type: Integer

Size/Length of multiview window. As a percentage of X dimension of multiview canvas. (0-99)

percentSizeY

Type: Integer

Size/Height of multiview window. As a percentage of Y dimension of multiview canvas. (0-99)

ly

Type: Integer

Window Layer. Value from 1-9 with layer 1 being the bottom layer and 9 being the top.

Examples

Using Percentages

set multiview myMview1 windowNumber 1 encoderName myEnc1 percentPositionX 50 percentPositionY 50 percentSizeX 25 percentSizeY 25 layer 3

Using Pixel Values

set multiview myMview1 windowNumber 1 encoderName myEnc1 pixelPositionX 1920 pixelPositionY 1080 pixelSizeX 800 pixelSizeY 600 layer 3

Related Commands

create multiview
delete videoWall
delete multiviewWindow
set multiview audioSource windowNumber
show multiviews config
show multiviews status
**set multiview (layer, position, size)**

Allows user to change a multiview window layer, position or size without specifying other parameters. *(ZyPer4K family only)*

**Syntax**

```plaintext
set multiview id windowNumber wn positionX posx positionY posy sizeX sx sizeY sy layer ly
```

**Parameters**

- **id**
  - Type: **STRING**
  - Name of previously created multiview. String names are case-sensitive.

- **wn**
  - Type: **Integer**
  - Window number within the multiview (1-19)

- **percentPositionX**
  - Type: **Integer**
  - X coordinate in percentage of multiview canvas. Upper left corner of window. (0-99)

- **percentPositionY**
  - Type: **Integer**
  - Y coordinate in percentage of multiview canvas. Upper left corner of window. (0-99)

- **pixelPositionX**
  - Type: **Integer**
  - X coordinate of multiview in multiview canvas. Upper left corner of window.

- **pixelPositionY**
  - Type: **Integer**
  - Y coordinate of multiview in multiview canvas. Upper left corner of window.

- **pixelSizeX**
  - Type: **Integer**
  - Size/Length of multiview window. Number of pixels in multiview canvas.
pixelSizeY
  Type: Integer
  Size/Height of multiview window. Number of Pixels in multiview canvas

percentSizeX
  Type: Integer
  Size/Length of multiview window. As a percentage of X dimension of multiview canvas. (0-99)

percentSizeY
  Type: Integer
  Size/Height of multiview window. As a percentage of Y dimension of multiview canvas. (0-99)

ly
  Type: Integer
  Window Layer. Value from 1-9 with layer 1 being the bottom layer and 9 being the top.

Examples

set multiview myMview1 windowNumber 2 layer 4 
Success

set multiview myMview1 windowNumber 2 size percentSizeX 50 percentSizeY 50 
Success

set multiview mv1 windowNumber 1 size pixelSizeX 500 pixelSizeY 400 
Success

Related Commands

create multiview
delete multiview
delete multiviewWindow
set multiview audioSource windowNumber
show multiviews config
show multiviews status
set multiview audioSource windowNumber

Selects the input source to provide Audio for multiview display. (ZyPer4K family only)

Syntax

set multiview id audioSource windowNumber arg

Parameters

id

Type: STRING

Name of previously created multiview. String names are case-sensitive.

arg

Type: STRING / Integer

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integer</td>
<td>Integer from 1-19 identifying source to use for audio</td>
</tr>
<tr>
<td>none</td>
<td>Set no audio for the multiview window</td>
</tr>
</tbody>
</table>

Example

set multiview myMview1 audioSource window number 4
Success

Related Commands

create multiview
delete multiview
delete multiviewWindow
show multiviews config
show multiviews status
set multiview windowNumber channel up/down

Cycles the encoder source up/down for a specified multiview window. (ZyPer4K family only)

Syntax

set multiview id windowNumber channel arg

Parameters

id
Type: STRING
Name of previously created multiview. String names are case-sensitive.

arg
Type: STRING
Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>up</td>
<td>Will cycle the encoder source in the specified multiview window to next higher numbered encoder. Will cycle around to lowest encoder number when maximum value is reached.</td>
</tr>
<tr>
<td>down</td>
<td>Will cycle the encoder source in the specified multiview window to next lower numbered encoder. Will cycle around to highest encoder number when minimum value is reached.</td>
</tr>
</tbody>
</table>

Examples

set multiview mv3x3 windowNumber 3 channel up
Channel changed to Z4Kenc_2
Success

set multiview mv3x3 windowNumber 3 channel up
Channel changed to Arts_Encoder_1
Success

Related Commands

create multiview
delete multiview
delete multiviewWindow
show multiviews config
show multiviews status
set multiview canvasSize

Selects the canvas size for creating multiview windows. (ZyPer4K family only)

Helpful feature to control bandwidth of scaled streams for a multiview. Default canvas size is 3840x2160. This can create case where datarate from encoder is greater than 9.5Gb limit. (Full size stream plus scaled stream.) Reducing the canvas size will reduce required size and datarate of scaled stream used for multiview.

Syntax

set multiview id canvasSize pixelsHoriz pixelVert

Parameters

id

Type: STRING

Name of previously created multiview. String names are case-sensitive.

pixelsHoriz

Type: Integer

Horizontal width of the multiview canvas. (640 to 8192)

pixelsVert

Type: Integer

Vertical height of multiview window. (480 to 8192)

Note: Maximum canvas pixels is 8,847,360

Example

set multiview MyView1 canvasSize 1920 1080
Success

Related Commands

create multiview
delete multiview
delete multiviewWindow
show multiviews config
show multiviews status
**set multiview newEncoderName**

Assigns a new encoder to an existing multiview window. (ZyPer4K family only)

**Syntax**

```
set multiview id windowNumber wn newEncoderName encName|none
```

**Parameters**

- **id**
  - Type: **STRING**
  - Name of previously created multiview. String names are case-sensitive.

- **wn**
  - Type: **Integer**
  - Window number within existing multiview. (1 to 19)

- **encName**
  - Type: **STRING / STRING**
  - The name or MAC address of the encoder. String names are case sensitive. None is also an option to remove existing encoder and replace with nothing.

**Example**

```
set multiview mv2x2-Art windowNumber 3 newEncoderName ABC
Success

set multiview mv2x2-Art windowNumber 3 newEncoderName none
Success
```

**Related Commands**

- `create multiview`
- `delete multiview`
- `delete multiviewWindow`
- `show multiviews config`
- `show multiviews status`
**set multiview title**

Used to create a text overlay in a multiview window. *(ZyPer4K family only)*

Create a string of text to be overlayed somewhere in a multiview window. Color of text and color of background can be specified. Size of text can be specified. Transparency of text and background can be specified. Note that 100% transparent setting is not fully transparent.

**Syntax**

```
set multiview id windowNumber wn title textString title
set multiview id windowNumber wn title text-size ts
set multiview id windowNumber wn title transparency text tt
    background bt
set multiview id windowNumber wn title color text tc background bc
```

**Parameters**

**id**

Type: **STRING**

Name of previously created multiview. String names are case-sensitive.

**wn**

Type: **Integer**

Window number within the multiview (1-19)

**ts**

Type: **Integer**

Size of text (1-10)

**tt**

Type: **Integer**

Text Transparency. Percentage (0-100)

**bt**

Type: **Integer**

Background Transparency. Percentage (0-100)
**tc**

Type: **STRING**

Text color. Can be any of the following options: black, blue, brown, cyan, darkBlue, gray, green, lightBlue, lightGray, lime, magenta, maroon, olive, orange, purple, red, silver, white, yellow.

**bc**

Type: **STRING**

Background color. Can be any of the following options: black, blue, brown, cyan, darkBlue, gray, green, lightBlue, lightGray, lime, magenta, maroon, olive, orange, purple, red, silver, white, yellow.

**title**

Type: **STRING**

Any text string to be associated and displayed in the selected multiview window. Strings contains spaces must be enclosed in quotations.

### Examples

```
set multiview MyView1 windowNumber 1 title textString "Window #1"
Success

set multiview MyView1 windowNumber 1 title textSize 10
Success

set multiview MyView1 windowNumber 1 title transparency text 0 background 100
Success

set multiview MyView1 windowNumber 1 title color black backgroundColor color green
```

### Related Commands

- `create multiview`
- `delete multiview`
- `delete multiviewWindow`

- `show multiviews status`
set preset commands auto

Used to update an existing preset commands

Syntax

set preset id commands auto connections

Parameters

id
Type: STRING
The name of the preset. String names are case-sensitive.

connections
Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>existingConnections</td>
<td>Uses the existing set of connections to create the command list</td>
</tr>
<tr>
<td>empty</td>
<td>Creates an empty set of commands. No connections</td>
</tr>
</tbody>
</table>

Example

set preset morning commands auto existingConnections
Success

set preset morning commands auto empty
Success

Related Commands

create preset
delete preset
run preset
show preset
**set preset commands blob**

Used to update an existing preset commands

**Syntax**

```plaintext
set preset id commands blob connections
```

**Parameters**

*id*

**Type:** STRING

The name of the preset. String names are case-sensitive.

*connections*

**Type:** STRING

Manually enter a list of commands contained within quotations. Insert a semi-colon between commands. Maximum character limit is 4096.

**Example**

```plaintext
set preset morning commands blob “join Cuba Bot-Left fast-switched; join NBC Bot_Right fast-switched; join Sports Top-Right fast-switched; join Media Player Top_Left fast-switched”
```

Below is image from ZMP GUI showing these commands in the Preset window:

**Commands:**

- join Cuba Bot-Left fast-switched
- join NBC Bot_Right fast-switched
- join Sports Top-Right fast-switched
- join Media Player Top_Left fast-switched

**Related Commands**

- create preset
- delete preset
- run preset
- show preset
**set preset description**

Used to update an existing preset description

Syntax

```
set preset id description description
```

Parameters

`id`

Type: **STRING**

The name of the preset. String names are case-sensitive.

`description`

Type: **STRING**

Updated description of the preset

Example

```
set preset morning description "Open for business"
```

Success

Related Commands

- create preset
- delete preset
- run preset
- show preset
set preset schedule eventColor

Used to update an existing preset schedule color in the calendar.

Syntax

set preset id schedule scname eventColor color

Parameters

id
Type: STRING
The name of the preset. String names are case-sensitive.

scname
Type: STRING
Name of the schedule.

color
Type: STRING
Name of the new color. Options include the following: aqua, aquamarine, black, blue, brown, coral, cyan, darkBlue, darkSlateGray, deepPink, deepSkyBlue, fuchsia, gray, green, hotPink, khaki, lightBlue, lightGray, lightSeaGreen, lightSlateGray, lime, magenta, maroon, mistyRose, olive, orange, pink, purple, red, silver, teal, web-hex-color starting with # (e.g. #22ffee), white, yellow, zvGreen, zvPurple

Example

set preset morning schedule opentime zvGreen
Success

Related Commands

create preset
delete preset
run preset
show preset
**set preset schedule month**

Used to update an existing preset schedule month/day/time to run

**Syntax**

```
set preset id schedule scname month month dayOfMonth day dayOfWeek
day hour hour minute minute
```

**Parameters**

**id**

Type: **STRING**

The name of the preset. String names are case-sensitive.

**scname**

Type: **STRING**

Name of the schedule.

**month**

Type: **STRING**

Months to run this preset: Options are all, jan, feb, mar, apr, may, jun, jul, aug, oct, nov, dec

**dayOfMonth**

Type: **Integer**

Days of the month to run this preset. Enter an integer date or “all”

**dayOfWeek**

Type: **STRING**

Days of week to run this preset: Options are all, sunday, monday, tuesday, wednesday, thursday, friday, saturday, weekday, weekend. (Note: Weekday = M-F, Weekend = Sat+Sun)

**hour**

Type: **String**

Hour to run this preset. Enter an integer time (24 hour format) or “all”
minute

Type: Integer

Enter the minute (0-59) for this preset to run.

Example

set preset test1 schedule LateLunch month all dayOfMonth all
dayOfWeek weekday hour 14 minute 30
Success

Related Commands

create preset
delete preset
run preset
show preset
**set responses rs232TermChars**

Specifies the termination character for an RS232 string. The default string is “\n\r”. Any character in the termination string causes the response-string to terminate and be placed into the response-string ring buffer.

This string is optional. If it is not specified, then the string is empty and each low-level response is handled as a separate response.

**Syntax**

```
set responses id chr
```

**Parameters**

- **id**
  - Type: **STRING or MAC Address**
  - The name or MAC address of the decoder. String names are case-sensitive.

- **chr**
  - Type: **STRING**
  - The specified string.

**Example**

```
set responses decoder2 rs232TermChars "\r"
Success
```

**Related Commands**

```
set device rs232
```
set server api lineWrap

Sets the number of characters the API will display in the Command Line Interface before wrapping to a new line.

Syntax

```
set server api lineWrap wrap
```

Parameters

`wrap`

Type: INTEGER

 Integer value from 100 to 512

Example

```
set server api lineWrap 200
Success
```
set server autoEdidMode

Sets the EDID mode for the Management Platform. By default, Auto-EDID mode is enabled.

Syntax

set server autoEdidMode mode

Parameters

mode

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disabled</td>
<td>Disables auto-EDID mode.</td>
</tr>
<tr>
<td>enabled</td>
<td>Enables auto-EDID mode.</td>
</tr>
</tbody>
</table>

Example

set server autoEdidMode disabled
Success

Related Commands

set server timezone
set server dataTunnelMode

Sets the transfer mode for the Management Platform.

Syntax

set server dataTunnelMode mode

Parameters

mode

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>raw</td>
<td>Sets raw communication mode.</td>
</tr>
<tr>
<td>telnet</td>
<td>Sets telnet communication mode.</td>
</tr>
</tbody>
</table>

Notes

Telnet is a way of passing control information about the communication channel. It defines line-buffering, character echo, etc, and is done through a series of will/wont/do/dont messages when the connection starts.

Raw is a TCP stream with no telnet escape sequences.

Telnet is an application layer protocol while TCP is a transport layer protocol. Telnet uses TCP in order to transmit data. That is a big fundamental difference between Telnet and TCP.

Example

set server dataTunnelMode telnet
Success

Related Commands

set server timezone
**set server date**

Used to set server date manually or via ntp server. Note: NTP Server must be IPV4

**Syntax**

```plaintext
set server date mode

set server date ntpServer address <domainName>

set server date manual month <int> day <int> year <int> hour <int> minute <int>
```

**Parameters**

*mode*

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>manual</td>
<td>Sets date/time manually</td>
</tr>
<tr>
<td>ntpServer</td>
<td>Sets date/time via ntp server. Must provide valid IP address for an ntp Server.</td>
</tr>
</tbody>
</table>

**Example**

```plaintext
set server date manual month 4 day 1 year 2021 hour 15 minute 1
Success

set server date ntpServer address 129.6.15.28
Success
```

**Link to NTP Servers:**

[https://tf.nist.gov/tf-cgi/servers.cgi](https://tf.nist.gov/tf-cgi/servers.cgi)

**Related Commands**

- `set server timezone`
- `show server config`
- `show server info`
set server discoverMode

Sets how ZyPerUHD endpoints are discovered by the Management Server on the network

Syntax

set server discoverMode mode

Parameters

mode

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>broadcast</td>
<td>Sets discovery mode to broadcast (Default)</td>
</tr>
<tr>
<td>multicast</td>
<td>Sets discovery mode to multicast</td>
</tr>
</tbody>
</table>

Notes

Allows the server to discover ZyPerUHD endpoints using multicast across subnets when multicast routing is enabled. When in multicast mode there must be a igmp querier running – usually that would be the multicast router querier.

Example

set server discoverMode multicast
Success

Related Commands

set server timezone
**set server encoderDefault audio**

Sets the default encoder audio format for HDMI audio input.

**Detailed Background**

ZeeVee added a feature that will allow compressed formats to be passed down in an encoder EDID file. This EDID will be then forwarded to the source device to determine the type of audio sent to the encoder.

This enhancement was to provide fastSwitched connections the “compressed audio” options in the EDID file. Prior to this version with the fast-switched connection, ZeeVee modified the EDID passed from the decoder to the encoder and removed all compression formats. This left just LPCM as the only option under the “Audio data block” in the edid file.

>>> Audio data block <<<

Linear PCM, max channels 8
Supported sample rates (kHz): 192 176.4 96 88.2 48 44.1 32
Supported sample sizes (bits): 24 20 16

The information provided to the Video Source device (such as BluRay Player or Media player) increases the possibility of compression being a chosen audio format. However it is still up to the device to choose uncompressed or compressed formats. It is important to know that some devices such as the Apple 4K TV requires the audio output type to be set (even if the audio format is available in the EDID). Compression will need to be set manually on these types of devices.

In addition any downmixed stream internal to ZyPer devices will not process compressed audio, so you will not hear compressed audio on these connections.

**Syntax**

```
set server encoderDefault edid audio mode
```

**Parameters**

`mode`

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allowCompressed</td>
<td>Passes the decoders edid with unmodified audio information and thus allows compression options to be seen.</td>
</tr>
<tr>
<td>onlyPcm</td>
<td>Forces the EDID modification described above</td>
</tr>
</tbody>
</table>
Example

set server encoderDefault edid audio allowCompressed
Success

Related Commands

set encoder edid audio

Additional Information

In an attempt to properly identify the Audio Streams used under the product the following changes were also made along with some modification to the API commands.

<table>
<thead>
<tr>
<th>Product</th>
<th>Old Audio Stream Name</th>
<th>New Stream Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>ZyPer4K</td>
<td>hdmi (used in genlocked mode)</td>
<td>hdmiPassthroughAudio</td>
</tr>
<tr>
<td>ZyPer4K</td>
<td>hdmi-audio-downmix</td>
<td>hdmiAudio</td>
</tr>
<tr>
<td>ZyPer4K</td>
<td>analog-audio</td>
<td>analogAudio</td>
</tr>
<tr>
<td>ZyPerUHD</td>
<td>audio</td>
<td>hdmiAudio</td>
</tr>
<tr>
<td>ZyPerUHD</td>
<td>analog-audio</td>
<td>analogAudio</td>
</tr>
<tr>
<td>ZyPerHD</td>
<td>Part of fast-switched connection</td>
<td>No Change</td>
</tr>
<tr>
<td>ZyPerHD</td>
<td>Part of fast-switched connection</td>
<td>No Change</td>
</tr>
</tbody>
</table>
**set server ip**

Sets the IP Address of the Management Platform. For MP hardware with multiple Network Interfaces this command is used to set the IP Address of each interface independently.

**Syntax**

```
set server ip id mode IP Address Mask Gateway DNS-Server reboot
```

**Parameters**

### id

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>Select the &quot;Video&quot; network. (ZyPer Network)</td>
</tr>
<tr>
<td>management</td>
<td>Select the “Management” network. (Non-ZyPer Network)</td>
</tr>
</tbody>
</table>

### mode

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>static</td>
<td>Manually select/assign IP Address</td>
</tr>
<tr>
<td>dhcp</td>
<td>Allow DHCP server to automatically assign IP Address</td>
</tr>
</tbody>
</table>

**Example**

```
set server ip server dhcp reboot
Success
```

```
set server ip server static 192.168.1.26 255.255.255.0 none none reboot
Success
```

```
set server ip management static 192.168.4.20 255.255.255.0 192.168.4.1 none reboot
Success
```

**Related Commands**

```
set server timezone
```
**set server isaac address**

Sets the domain name of the isaac server.

**Syntax**

```
set server isaac address domainname
```

**Parameters**

*domainname*

Type: **STRING**

domainname of the Isaac server

**Example**

```
set server isaac address
Success
```

**Related Commands**

*set server isaac subsystemId*
**set server isaac subsystemId**

Sets the subsystemID on isaac server.

**Syntax**

`set server isaac address subsystemId`

**Parameters**

`subsystemID`

Type: **STRING**

Subsystem ID of the Isaac server

**Example**

`set server isaac subsystemId Wallyworld`

Success

**Related Commands**

`set server isaac address`
set server license

Sets the license for the Management Platform. This controls the maximum number of endpoints supported by the Management Platform

Syntax

set server license key

Parameters

key

Type: STRING

License key obtained from ZeeVee that sets maximum number of endpoints

Example

set server license QDZV-AYYA-0048-303D-5C0E-BD5D-56AA-154D-976C-BCE3-BAC4
Success

Related Commands

set server autoEdidMode
**set server redundancy**

Sets a virtual IP address and Mask for the Master and Slave Management Platforms in the system. (See Appendix for additional Redundancy Configuration Instructions)

**Syntax**

```
set server redundancy serv_id virtualIp address IP_Address
networkInterface video|management
```

**Parameters**

**serv_id**

Type: STRING

The servers to apply Virtual-ID to.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allServers</td>
<td>All Management Platforms on the Network. (Master and Slave)</td>
</tr>
<tr>
<td>thisServer</td>
<td>The specific server (Master or Slave) currently logged into.</td>
</tr>
<tr>
<td>server IP Address</td>
<td>Manually enter IP address of a specific Management Platform. (Master or Slave)</td>
</tr>
</tbody>
</table>

**IP_Address and Mask**

Type: STRING

Virtual IP address with Subnet Mask

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Virtual IP address to use for designated servers: Example: 192.168.0.25</td>
</tr>
<tr>
<td>networkInterface</td>
<td>Selects either the Video or Management interface for MP units with Dual Network Interfaces</td>
</tr>
</tbody>
</table>

**Note:** The virtual address has to be accessible within the subnet already defined for the interface. So, if the "video network", aka the original interface has 172.6.2.22/24, then the virtual address has to be 172.16.2.xxx.
Examples

set server redundancy allServers virtualIp address 192.168.0.25
networkInterface video
Success

set server redundancy thisServer preferredMaster true
preferredSlave false
Success

set server redundancy 192.168.1.202 preferredMaster false
preferredSlave true
Success
set server ssh password

Sets the password for ssh access.

The ssh account is: zyper
The default password is: zyper

If a password is not provided, then the current password will be deleted. In this case, no password prompt will be displayed.

Syntax

set server ssh password pass

Parameters

pass

Type: STRING

The desired password. (String with length from 4 to 64 characters)

Valid Password Characters include: a - z A - Z 0 - 9 ~ ! @ # $ % ^ * _ - = + { } [ ] , . / ? :
Invalid Password Characters include: & ( ) | \ ; ' "`

Examples

set server ssh password biGB055
Success

ssh zyper@<ip_address>

Notes

To reset system to no ssh password:
FTP the empty file named “defaultPasswords” to the /files directory of the MP (no file extension)
Power cycle the MP within 1 minute, when it comes back the passwords will be defaulted.

This provides the very secure requirement of having physical access to the MP in order to reset the password.

Related Commands

set server autoEdidMode
set server telnet password
set server telnet mode
set server timezone
set server telnet password

Sets the password for Telnet. If a password is not provided, then the current password will be deleted. In this case, no password prompt will be displayed.

By default Telnet has no password.

Syntax

set server telnet pass

Parameters

pass
  Type: STRING
  The desired password.

Example

set server telnet password biGB055
Success

Notes

To reset system to no telnet password:
FTP the empty file named “defaultPasswords” to the /files directory of the MP (no file extension)
Power cycle the MP within 1 minute, when it comes back the passwords will be defaulted.

This provides the very secure requirement of having physical access to the MP in order to reset the password.

Related Commands

set server autoEdidMode
set server ssh password
set server telnet mode
set server timezone
**set server telnet mode**

Used to enable or disable telnet access to the server.

**Syntax**

```
set server telnet mode mode
```

**Parameters**

*mode*

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Telnet access is enabled</td>
</tr>
<tr>
<td>disabled</td>
<td>Telnet access is disabled</td>
</tr>
</tbody>
</table>

**Example**

```
set server telnet mode disabled
Success
```

**Example trying to access via Telnet once disabled**

```
telnet 192.168.0.78
Trying 192.168.0.78...
telnet: connect to address 192.168.0.78: Connection refused
telnet: Unable to connect to remote host
```

**Related Commands**

- `set server autoEdidMode`
- `set server ssh password`
- `set server telnet password`
- `set server timezone`
**set server timezone**

Sets the time zone for the Management Platform. The time zone must be specified in POSIX format.

**Syntax**

```
set server timezone zone
```

**Parameters**

`zone`

*Type: STRING*

The time zone in POSIX format.

**Example**

```
set server timezone America/New_York
Success
```

**Link to list of POSIX format timezones:**

**Related Commands**

- `set server autoEdidMode`
- `set server date ntpServer address <domainName>`
- `set server date manual month <int> day <int> year <int> hour <int> minute <int>`
- `show server info`
- `show server config`
set terminal output

Set terminal output options between normal and JSON format.

The web interface has always been “JSON encoded responses” (computer friendly). The major benefit for this is for a web app to easily process the response. The downside is that it’s not at all “human friendly”.

There are two output format options from the API. One over telnet and ssh that is human friendly, and one over http that's computer friendly.

This new command allows users to select the format of responses from the API.

Syntax

set terminal output normal|json echo yes|no prompt yes|no

Parameters

normal | json - allows user to select between these two options

echo - allows characters/commands to be seen while typing in telnet/ssh session

prompt - provides “ZyPer$” prompt as que for entering commands in telnet/ssh session

Examples

set terminal output normal echo yes prompt yes
Success

set terminal output json echo yes prompt yes
[   114]{“status”:“Success”,“text”:[],“errors”:[],“warnings”:[],“command”:“set terminal output json echo yes prompt yes ”}

set terminal output json echo no prompt yes
[   112]{“status”:“Success”,“text”:[],“errors”:[],“warnings”:[],“command”:“set terminal output json echo no prompt yes”}

Warning

Removing echo feature from a normal Telnet or SSH session can be challenging as the user would no longer be able to see the commands being typed into the Telnet or SSH window. Copy/paste the first example above to return to normal operation.
set videoWall size

Changes the size of the specified video wall and bezel parameters. Bezel values are measured in pixels.

Setting bezel values will affect a resolution change to the display. If the resolution is not supported by the display, then the display will have no picture. If this is the case, try assigning a different bezel pixel value.

Syntax

set videoWall id size rows cols topBezel bezt bottomBezel bezb leftBezel bezl rightBezel bezr

Parameters

id
Type: STRING
The name of the video wall. String names are case-sensitive.

rows
Type: INTEGER
The number of rows. (Maximum 15 for ZyPer4K, Maximum 15 for ZyPerUHD, Maximum 4 for ZyPerHD)

cols
Type: INTEGER
The number of columns. (Max 15 for ZyPer4K, Max 15 for ZyPerUHD, Max 4 for ZyPerHD)

bezt
Type: INTEGER
The top bezel pixel value.

bezb
Type: INTEGER
The bottom bezel pixel value.

bezl
Type: INTEGER
The left bezel pixel value.
bezr

Type: **INTEGER**

The right bezel pixel value.

**Note:** Bezel adjustment only supported on ZyPer4K family

**Example**

```plaintext
set videoWall Mywall1 size rows 5 columns 5 topBezel 0 bottomBezel 0 leftBezel 0 rightBezel 0
Success
```

**Related Commands**

- `create videoWall`
- `set videoWall`
- `show videoWalls`
- `join videoWall`
- `set videoWall newName`
**set videoWall decoder**

Assigns the specified decoder, to the desired row and column, on the specified video wall.

**Syntax**

```
set videoWall wallid decoder id row col
```

**Parameters**

`id`

Type: **STRING or MAC Address**

The name or MAC address of the decoder. String names are case-sensitive. If `none` is passed as the argument, then any existing display is disconnected from that position in the video wall.

`wallid`

Type: **STRING**

The name of the video wall. String names are case-sensitive.

`row`

Type: **INTEGER**

The row of the specified video wall.

`col`

Type: **INTEGER**

The column of the specified video wall.

**Example**

```
set videoWall myVideoWall decoder myDecoder row 2 column 3
```

Success

**Related Commands**

- create videoWall
- set videoWall
- show videoWalls
- join videoWall
**set videoWall newName**

Changes the name of an existing video wall

**Syntax**

```
set videoWall id newName name
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The name or MAC address of the encoder. String names are case-sensitive. If *none* is passed as the argument, then the display is disconnected from that position in the video wall.

**name**

Type: **STRING**

The updated name of the video wall.

**Example**

```
set videoWall myWall2 newName yourWall2
```

Success

**Related Commands**

- `create videoWall`
- `set videoWall`
- `show videoWalls`
- `join videoWall`
show dataTunnels

Shows what rs232 or IR data relay ports are opened on the server.

The feature of data-relays was added to allow a third party to connect to the ZMP server with a specific port and pass raw or telnet API commands (depending on the mode) to the server and port which is designated for a particular encoder or decoder.

Syntax

show dataTunnels

Parameters

none

Example

show dataTunnels
dataSessions(d8:80:39:9a:96:7);
   device: name=Cuba
   irTunnel: port=1234
   irTunnel-connections: none
Success

Related Commands

dataConnect
set server dataTunnelMode
show device capabilities

Displays device capabilities for the specified device(s).

Syntax

show device capabilities id select [since]

Parameters

id
Type: STRING or MAC Address

The identifier of the device. Either the full or portion of a string name or MAC address can be supplied.

select
Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays configuration information for all available devices.</td>
</tr>
<tr>
<td>encoders</td>
<td>Only encoders are displayed.</td>
</tr>
<tr>
<td>decoders</td>
<td>Only decoders are displayed.</td>
</tr>
</tbody>
</table>

since
This parameter is optional and can be specified to display units based on the number of changes, using the lastChangeId value on each device. However, if used, a lastChangeId value must follow. Supply the since argument before the providing the lastChangeId value.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>since</td>
<td>Required when using this parameter.</td>
</tr>
</tbody>
</table>
Example

show device capabilities MyEnc1 since 20
device(d8:80:39:eb:1:cb);
    device.gen; lastChangeId=28
device.CapabilitiesVersion; values=1
device.analogAudioPort; values=none:hdmiAudioDownmix
device.colorDepth; values=fastSwitchDeepColor:multiviewDeepColor
device.colorEncoding; values=fastSwitchSubsample:multiviewSubsample
device.edid; values=save:load
device.edidAudioFormat; values=onlyPcm:allowCompressed:serverDefault
device.ethernetManagementPortMode; values=enabled:disabled
device.factoryDefaults; values=supported
device.firmwareUpdate; values=...apz
device.flashLeds; values=supported
device.hdcpMode; values=enabled:enabled1.4:disabled
device.hdmestatus; values=link:hdcp:resolution:fps
device.ipMode; values=dhcp:static
device.ipStaticGateway; values=supported
device.ir; values=device:server:none
device.joinAudio; values=analogAudio:hdmiAudio
device.joinUsb; values=false
device.joinVideo; values=fastSwitched:genlocked:genlockedScaled:multiview:window
device.multiview; values=title
device.previewStream; values=enabled:disabled
device.rs232; values=device:server:none
device.sendMulticasts; values=settable
device.streamMcastSettable; values=video:analogAudio:hdmiAudio
device.streamModeSettable; values=video:hdmiAudio:videoScaled:analogAudio
device.streamsSupported; values=video:hdmiAudio:videoScaled:analogAudio
device.temperature; values=main
device.usbFilter; values=none
device.videoPort; values=hdmi:auto
device.videoWall; values=maxSize(15):bezelsSupported
lastChangeIdMax(29);
Success

Related Commands

show device status
show device config
show device config

Displays device information for the specified device(s).

Syntax

show device config id select [since]

Parameters

id

Type: STRING or MAC Address

The identifier of the device. Either the full or portion of a string name or MAC address can be supplied. Can also enter in one of the arguments below.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays configuration information for all available devices.</td>
</tr>
<tr>
<td>commands</td>
<td>Shows all the command used to configure every device, multiview, video wall in the system</td>
</tr>
<tr>
<td>encoders</td>
<td>Only encoders are displayed.</td>
</tr>
<tr>
<td>decoders</td>
<td>Only decoders are displayed.</td>
</tr>
</tbody>
</table>

since

This parameter is optional and can be specified to display units based on the number of changes, using the lastChangeId value on each device. However, if used, a lastChangeld value must follow. Supply the since argument before the providing the lastChangeId value.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>since</td>
<td>Required when using this parameter.</td>
</tr>
</tbody>
</table>
Example

show device config Curved
device(d8:80:39:9a:e6:d);
  device.gen; model=Zyper4K, type=encoder, name=Curved, state=Up,
  lastChangeId=124
device.gen; firmware=4.0.1.0
device.gen; ethernetManagementPortMode=disabled
device.hDMI; hdcpMode=enabled
device.ports; videoPort=hdmi
device.ip; mode=dhcp, address=172.16.6.33, mask=255.255.255.0,
gateway=172.16.6.1
device.rs232; sendingToMacOrIp=Top-Right(172.16.6.42),
terminationChars=\x0A\x0D, baudrate=57600, dataBit=8, stop_Bit=1,
  parity=none
device.ir; sendingToMacOrIp=Bot_Right(172.16.6.71)
device.source; iconImageName=foxSports, manufacturer=none,
  model=none, location=none, serialNumber=none
device.audioOutSourceType; analogOutSourceType=none
device.edid; loadMode=auto, audio=serverDefault
device.sendIpMcastRange; first=224.1.1.1, last=239.255.255.255
device.videoStream; ipMcastAddr=224.1.1.1, mode=enabled
device.videoScaledStream; ipMcastAddr=224.1.1.1, mode=disabled,
  sizeX=0, sizeY=0
device.analogAudioStream; ipMcastAddr=0.0.0.0, mode=disabled
device.hDMIAudioStream; ipMcastAddr=224.1.1.16, mode=enabled
device.previewStream; mode=disabled
lastChangeIdMax(125);
Success

Related Commands

  show device status
  show device capabilities
  show device connections
**show device connections**

Shows encoder connections to decoders

**Syntax**

```
show device connections
```

**Parameters**

`none`

**Example**

```
show device connections
encoder.GalapogosHD; BotLeftHD
encoder.RaptorsHD; SamsungHD
encoder.MuralsHD; BotRightHD
encoder.Soccer4K; TopRight, BotLeft
Success
```

**Related Commands**

- `show device status`
- `show device capabilities`
- `show device config`
**show device status**

Displays status information for the specified device(s). This command functions the same as the `show device config` command.

**Syntax**

```plaintext
show device status id [since]
```

**Parameters**

- **id**
  - **Type:** STRING or MAC Address
  - The identifier of the device. Either the full or portion of a string name or MAC address can be supplied.

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays configuration information for all available devices.</td>
</tr>
<tr>
<td>encoders</td>
<td>Only encoders are displayed.</td>
</tr>
<tr>
<td>decoders</td>
<td>Only decoders are displayed.</td>
</tr>
</tbody>
</table>

- **since**
  - This parameter is optional and can be specified to display units based on the number of changes. Supply this argument followed by the desired value to query.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>since</td>
<td>Required when using this parameter.</td>
</tr>
</tbody>
</table>
Example

```
show device status Cuba

show responses
Displays response strings from the specified device.

Syntax

show responses id type param3

Parameters

id
Type: STRING or MAC Address
The name or MAC address of the device. String names are case-sensitive.

type
Type: STRING
Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ir</td>
<td>Displays IR response strings.</td>
</tr>
<tr>
<td>rs232</td>
<td>Displays RS232 response strings.</td>

</tbody>
</table>

param3
Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>last</td>
<td>Displays the last received response, based on the argument supplied for the type parameter.</td>
</tr>
<tr>
<td>lastChangeId</td>
<td>Displays the lastChangeId of the most recently received response.</td>
</tr>
<tr>
<td>since</td>
<td>Displays only new response data. Follow this argument with desired value to query.</td>
</tr>
</tbody>
</table>
Example

show responses 0:1e:c0:f6:b0:8a rs232 since 10
lastChangeId(0);
Success

show responses 0:1e:c0:f6:b0:8a ir lastChangeId
lastChangeId(0);
Success

show responses 0:1e:c0:f6:b0:8a ir last
lastChangeId(0);
Success

show responses UHDdec1 rs232 last
device(34:1b:22:80:64:68);
   device.rs232Response.19; string="Yes ZeeVee Support is the
Greatest\x0D"
lastChangeId(20);
Success

Zyper$ show responses UHDdec1 rs232 since 19
device(34:1b:22:80:64:68);
   device.rs232Response.19; string="Yes ZeeVee Support is the
Greatest\x0D"
   device.rs232Response.20; string="Really, still the greatest!\x0D"
lastChangeId(21);
Success
**show server config**

Displays configuration information for the Management Platform.

**Syntax**

```
show server config
```

**Parameters**

`none`

**Example**

```
show server config
server(192.168.0.22);
  server.gen; autoEdidMode=enabled, redundancy=enabled
  server.ipServerAddress; mode=static, address=192.168.0.22,
    mask=255.255.255.0, gateway=none, dns=none
  server.ipManagementAddress; mode=none, address=NA
  server.ntpServer; address=ntp.ubuntu.com
  server.telnetAccess; mode=enabled
  server.encoderDefault.edid; audio=onlyPcm
  server.dataTunnelMode; telnet=telnetHandshakeMode
  server.logging; level=1
  server.isaac; address=none, subsystemId=none
Success
```

**Related Commands**

```
show server info
```
**show server info**

Displays information for the Management Platform, including IP settings, uptime, and license level.

### Syntax

```
show server info
```

### Parameters

**none**

### Example

```
show server info
server(192.168.0.22);
   server.gen; hostname=zyper.local, version=2.3.36999,
   previousVersion=2.2.36870,
   macAddress=94:c6:91:a0:47:fc, serialNumber=ZZM1K400011D
   server.gen; uptime=3d:21h:25m:24s, freeMem= 6.71GB, bootCount=173
   server.gen; runningInVm=false
   server.ipActive; ipServerAddr=192.168.0.22, ipManagementAddr=NA,
   gatewayAddr=none, dnsAddr=none
   server.time; time="Tue Aug 31 08:43:59 2021",
   timezone=America/New_York
   server.pollStats; count=0, interval: 0-minutes, monListSize=0
   server.license; productID=F9188182-AF72-C6C8-92C6-94C691A047FC,
   license=none
   server.license; Zyper4KLimit=24, Zyper4KDevices=6, allDevices=12,
   allDevicesUp=6, Zyper4KDevicesExceeded=0
   server.deviceUpdates; active=0
   server.activeDeviceVersions; num_0.0.0.0=1, num_2.0.4.0=2,
   num_4.1.2.0=3
Success
```

### Related Commands

```
show server config
revert server
```
**show server redundancy**

Displays information about master and slave Management Platforms

**Syntax**

```
show server redundancy
```

**Parameters**

```
one
```

**Example**

```
show server redundancy
server(172.16.6.111);
  server.status; state=master, version=2.1.1.36527, wasMaster=true, 
  wasSlave=true
  server.config; preferredMaster=true, preferredSlave=true
  server.virtualIp; address=0.0.0.0, networkInterface=video
Success
```

**Related Commands**

```
set server redundancy
redundancy switchover
```
**show snmp**

Displays information related to SNMP. *(Please see Section 5 of this manual for additional details on SNMP support)*

**Syntax**

```
show snmp arg
```

**Parameters**

*type*

Type: **STRING**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trapServers</td>
<td>Displays snmp trap servers.</td>
</tr>
<tr>
<td>users</td>
<td>Displays snmp users.</td>
</tr>
</tbody>
</table>

**Example**

```
show snmp trapServers
snmp(172.16.6.111);
Success

show snmp users
snmp(172.16.6.111);
Success
```

**Related Commands**

`add snmp`

`delete snmp`
show values

Shows all possible information/values associated with encoders, decoders, servers or multiviews.

Syntax

show values arg

Parameters

arg

Type: STRING

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays all values encoders, decoders, servers and multiviews. (Status, Config, Info, Redundancy)</td>
</tr>
<tr>
<td>encoder status</td>
<td>Shows values associated with encoder status</td>
</tr>
<tr>
<td>encoder config</td>
<td>Shows values associated with encoder config</td>
</tr>
<tr>
<td>decoder status</td>
<td>Shows values associated with decoder status</td>
</tr>
<tr>
<td>decoder config</td>
<td>Shows values associated with decoder config</td>
</tr>
<tr>
<td>server info</td>
<td>Shows values associated with server info</td>
</tr>
<tr>
<td>server config</td>
<td>Shows values associated with server config</td>
</tr>
<tr>
<td>server redundancy</td>
<td>Shows values associated with server redundancy</td>
</tr>
<tr>
<td>multiview status</td>
<td>Shows values associated with multiview status</td>
</tr>
<tr>
<td>multiview config</td>
<td>Shows values associated with multiview config</td>
</tr>
</tbody>
</table>

Examples

show values server config
values(serverConfig);
server.ipServerAddress.mode; values=dhcp|static
server.ipManagementAddress.mode; values=none|dhcp|static
server.telnetAccess; values=enabled|disabled
server.encoderDefault.edid.audio; values=onlyPcm|allowCompressed
server.dataTunnelMode; values=telnet|raw
server.logging; values=<integer 1-5>
Success
Examples

show values encoder config
values(encoderConfig);
   device.gen.ethernetManagementPortMode; values=enabled|disabled
device.gen.name; values=<string 1-256>
device.ip.mode; values=dhcp|static|linkLocal
device.ip.address; values=<IPv4Address>
device.ip.mask; values=<IPv4Mask>
device.ip.gateway; values=<IPv4Address>|NA
device.rs232.baud; values=2400|9600|19200|38400|57600|115200
device.rs232.parity; values=none|even|odd
device.ports.videoPort; values=auto|initializing|unknown|
hdmi|displayPort|hdmiOptionalIn|vga|component|composite|s-video|analogNone|hdsdi
device.analogAudioStream.mode; values=enabled|disabeld
device.audioOutSourceType.analogOutSourceType; values=analogAudio|hdmiAudioDownmix
device.edid.loadMode; values=auto|file
device.edid.audio; values=onlyPcm|allowCompressed|serverDefault
device.hdmi.hdcpMode; values=enabled|disabled|enabled1.4
device.hdmiAudioStream.mode; values=enabled|disabeld
device.previewStream.mode; values=enabled|disabeld
device.previewStream.type; values=hls|jpeg
device.previewStream.width; values=auto|<integer 180-400>
device.usb.downlinks; values=[none] | [mac=<decMac1>|link_1, name=<decName1>|existsButUnknown], [mac=<decMacN>|link_N, name=<decName N>|existsButUnknown]
device.usb.filter; values=none|exceptHid|storage
device.videoStream.mode; values=enabled|disabeld
device.videoScaledStream.mode; values=enabled|disabeld
Success
**show videoWalls**

Displays all video walls that have been created and all associated information.

**Syntax**

```plaintext
show videoWalls
```

**Parameters**

```plaintext
none
```

**Example**

```plaintext
show videoWalls
videoWall(wall1);
    videoWall.gen; videoSourceMac=None, numDisplayRows=2, numDisplayCols=2
    videoWall.bezel; top=0, bottom=0, left=0, right=0
    videoWall.decodersRow1; col1=Top_Left, col2=Top-Right
    videoWall.decodersRow2; col1=Bot-Left, col2=Bot_Right
```

Success

**Related Commands**

```plaintext
create videoWall
set videoWall
```
**show zones**

Displays all zones that have been created and all associated information.

**Syntax**

```
show zones
```

**Parameters**

```
none
```

**Example**

```
show zones
  1stfloor; Top-Right, Top_Left
  1stfloor.1stfloorroom2; empty
Success
```

**Related Commands**

```
add zoneDisplay
create zone
delete zone
delete zoneDisplay
```
**shutdown server**

Performs a shutdown of the Management Platform.

**Syntax**

```
shutdown server
```

**Parameters**

```
none
```

**Example**

```
shutdown server
Success
Connection closed by foreign host.
```

**Related Commands**

```
restart server
```
**sleep**

Specifies a sleep duration in milliseconds. This command is sometime required when executing a series of commands within a web page, using AJAX. Often times, a pause must occur in order for a device or the Management Platform to change states before another command is executed.

**Syntax**

```plaintext
sleep ms
```

**Parameters**

*ms*

Type: **INTEGER**

The duration in milliseconds.

**Example**

```plaintext
sleep 500
Success
```

**Related Commands**

*script*
**start encoder**

Used to start a specific encoder multicast stream. This command only has affect if at least one decoder has been “joined” to the encoder and the “encoder stop” command has been used to override the enabling of the encoder stream. In effect, this command removes a previously entered “encoder stop” command – it returns stream control to normal operation based on existing “join” configuration. The command will immediately restore stream operation based on existing join configuration. No further join commands are required. *(ZyPer4K family only)*

**Syntax**

```
start encoder id stream arg
```

**Parameters**

**id**

Type: **STRING or MAC Address**

The identifier of the device. Either the full or portion of a string name or MAC address can be supplied.

**arg**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analogAudio</td>
<td>analog audio multicast stream.</td>
</tr>
<tr>
<td>hdmiAudio</td>
<td>downmix audio multicast stream</td>
</tr>
<tr>
<td>video</td>
<td>full scale video stream</td>
</tr>
<tr>
<td>videoScaled</td>
<td>downscaled video stream (for multiview)</td>
</tr>
</tbody>
</table>

**Example**

```
start encoder Myencoder1 stream video
Success
```

**Related Commands**

*stop encoder*
**stop encoder**

Used to stop a specific encoder multicast stream. This command only has affect if at least one decoder has been "joined" to the encoder. In effect, this command overrides any existing "join" command – either present or future. *(ZyPer4K family only)*

When stopping a "scaled-video" stream, any multiview window receiving that stream will go black. The rest of the multiview will be unaffected.

**Syntax**

```
stop encoder id stream arg
```

**Parameters**

**id**

Type: STRING or MAC Address

The identifier of the device. Either the full or portion of a string name or MAC address can be supplied.

**arg**

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analogAudio</td>
<td>analog audio multicast stream.</td>
</tr>
<tr>
<td>hdmiAudio</td>
<td>downmix audio multicast stream</td>
</tr>
<tr>
<td>video</td>
<td>full scale video stream</td>
</tr>
<tr>
<td>videoScaled</td>
<td>downscaled video stream (for multiview)</td>
</tr>
</tbody>
</table>

**Example**

```
stop encoder Myencoder1 stream videoScaled
Success
```

**Related Commands**

*start encoder*
**switch**

This command is used in conjunction with the IR and RS232 switching commands. Both the `rs232` and the `ir` argument specify unidirectional connection between two devices. When switching data to the server, use the `show responses` command to retrieve the data.

**Syntax**

```
switch txid rxid type
```

**Parameters**

**txid**

*Type: STRING or MAC Address*

The name or MAC address of the encoder. String names are case-sensitive.

**rxid**

*Type: STRING or MAC Address*

The name or MAC address of the decoder. String names are case-sensitive.

**type**

*Type: STRING*

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ir</code></td>
<td>Specifies a IR connection. (ZyPer4K family and ZyPerUHD only)</td>
</tr>
<tr>
<td><code>rs232</code></td>
<td>Connection to another device or the server. Set <code>rxid = none</code> to pass data to an arbitrary IP host.</td>
</tr>
</tbody>
</table>

**Example**

```
switch Wildlife SonyXBR4 rs232
Success
```

**Related Commands**

`send`
### troubleReport

Generates capture logs and system state information and is used by the ZeeVee support team for troubleshooting purposes. This file is in .tgz format and is written to the /srv/ftp/files folder on the Management Platform.

#### Syntax

```
troubleReport
```

#### Parameters

**none**

#### Example

```
troubleReport
Creating Trouble Report
Saving device status and configuration...
Saving SQL database...
Saving system files...
Saving rcServerMain binary file...
Saving device EDIDs...
Saving device specific information; this may take a few seconds...
Success
```
update device

Updates the firmware on the encoder and/or decoder units. The firmware update file uses the .apz or .zip extension.

Syntax

update device arg file

Parameters

arg

Supply one of the following arguments.

<table>
<thead>
<tr>
<th>argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Encoder or Decoder name. Names are case-sensitive</td>
</tr>
<tr>
<td>all</td>
<td>All encoders and decoders in the system</td>
</tr>
<tr>
<td>encoders</td>
<td>All encoders in the system</td>
</tr>
<tr>
<td>decoders</td>
<td>All decoders in the system</td>
</tr>
</tbody>
</table>

file

Type: STRING

The full filename of the software file.

Example

update device all Z4K_Firmware_HDMI2.0_v3.5.2.0.apz

Warning: (18) Firmware updating started, use 'show device status' to monitor progress

Success
**update server**

Updates the Management Platform software. The server software file uses the `.zyper` extension. Refer to Updating the Software (page 259) for more information on using this command.

**Syntax**

```
update server file
```

**Parameters**

`file`

*Type: STRING*

The full filename of the software file.

**Example**

```
update server new-software-file.zyper
```

Success

Server rebooting; connection will end

**Important Note:**

The ZyPer MP update file will be available in three, platform-specific versions. Please use the correct version for the hardware platform being updated.

- ZyPerMP NUC computer: update_nuc_2.2.xxxxx.zyper
- ZyPerMP Proserver: update_proserver_2.2.xxxxx.zyper
- ZyPerMP VMware: update_vm_2.2.xxxxx.zyper
4 Event Mechanism
events

ZMP Event Mechanism

There are three ways to receive events:
• Second telnet session to receive events asynchronously. Session not used for API commands, only to receive events.
• Browser WebSocket to ZMP server. Allows server to asynchronously send events to the browser.
• Reliable, low-overhead API command to poll for events.

Event Message Format

Event::<name>::<source>::<date>::<lastChangeId>::: <Message>

Where:

source  device-name or “server”

Example:

state=Up

Telnet Event Session

• Client telnets to the ZMP server as normal
• API prompt received
• Command entered: “events”
  o Causes the event mode to be entered
  o Server sends initial events (described below) and new events as they occur to this telnet session
  o Any character entered to the server causes the mode to exit back to the API prompt

Browser WebSocket

Client usage of a WebSocket to receive events is quite simple. Example JavaScript from the sample zyper.html file shows how to connect to the websocket server on ZMP. Upon connection, initial events (described below) will be sent, and then any new events as they occur.

eventSock = new WebSocket("ws://rey:8001", "zeeVeeLogging"
eventSock.onopen = eventSockOpened;
eventSock.onMessage = eventRcvd;
eventSock.onclose = eventSockClosed;

function eventSockOpened() {
    eventSock.send("Send Events");   // ignored by server
}
function eventRcvd(event) {
    var evWin = document.getElementById('eventWindow');
evWin.innerHTML += event.data + "<br>";
evWin.scrollTop = evWin.scrollHeight;
}
function eventSockClosed() {
    console.log("EVENT SOCK CLOSED");
}
API Polling

The “show events since <id>” command may be used over telnet or from a browser using AJAX/JSON and preferably long-polling. It is a simple, low overhead and very reliable mechanism to ensure all events have been received.

```
Zyper$ show events since 0
server(172.16.2.169);
    server.event.0; event="Mon Jun 18 18:44:06 2018: ip=172.16.2.64, state=down->master"
    server.event.1; event="Mon Jun 18 18:44:10 2018: state=up"
    server.event.2; event="Mon Jun 18 18:44:10 2018: state=up"
    ...
    server.event.28; event="Tue Jun 19 05:00:03 2018: sizeX=1280->720, sizeY=720->480, fps=60.00->60.00"
    server.event.29; event="Tue Jun 19 05:01:24 2018: cable=disconnected"
    server.event.30; event="Tue Jun 19 05:01:26 2018: cable=connected"
    server.event.31; event="Tue Jun 19 05:01:26 2018: sizeX=720->1280, sizeY=480->720, fps=60.00->60.00"
l...```}

```
l
lastChangeId(32);
Success

Zyper$
```
Zyper$ show events since 28
server(172.16.2.169);
    server.event.28; event="Tue Jun 19 05:00:03 2018: sizeX=1280->720, sizeY=720->480, fps=60.00->60.00"
    server.event.29; event="Tue Jun 19 05:01:24 2018: cable=disconnected"
    server.event.30; event="Tue Jun 19 05:01:26 2018: cable=connected"
    server.event.31; event="Tue Jun 19 05:01:26 2018: sizeX=720->1280, sizeY=480->720, fps=60.00->60.00"
l...```}

```
l
lastChangeId(32);
Success

Zyper$
```
Zyper$ show events since 32
lastChangeId(32);
Success

Zyper$
```

Initial Events
Upon entering telnet “events” mode, or upon a WebSocket connection, the server will send a DeviceStatus event for each known device. Each of these events will have lastChangeId set to 0.
**Event List**

**ServerIpChanged:**

**Message:** `ipAddress=<from>-<to>`

**Example:**

```
ipAddress=169.254.1.10->172.16.2.22
```

**ServerStateChange:**

**Message:** `state=<from>-<to>`

**serverState:**
- down
- initialization
- master
- slave-sync
- slave
- slave-switching-over
- slave-db-updating
- not-participating
- slave-waiting-for-master
- slave-version-mismatch

**Example:**

```
state=slave->master
```

**NewServer:**

**Message:** `id=<id>, ip=<ipAddr>, state=<serverState>`

**Example:**

```
```

**OtherServerStateChange:**

**Message:** `ip=<ipAddr>, state=<from>-<to>`

**Example:**

```
```
DeviceStatus: initial device state

Message: state=down

Message: state=up, uptime=<seconds>, cable=disconnected

Message: state=up, uptime=<seconds>, cable=connected, sizeX=<pixels>, sizeY=<pixels>, fps=<fps>

Message (DECODER): state=up, uptime=<seconds>, cable=connected, sizeX=<pixels>, sizeY=<pixels>, fps=<fps>, receivingVideoFromEncoder r=no|yes|yes-with-warning [, reason=<reason> | warning=<warning>]

"no" reason list:
- decoder not joined
- decoder down
- decoder hdmi down
- encoder down
- encoder stream disabled
- encoder hdmi down
- display does not support resolution
- encoder and decoder hdcp do not match
- encoder has unsupported color format
- encoder data rate exceeded
- decoder data rate exceeded
- multiview error -- do 'show multiviews status'
- decoder resolution < UHD; can't join multiview
- encoder resolution < UHD; can't join video-wall
- encoder has multiview conflict with genlock
- problem with network connection

"yes-with-warning” warning list:
- multiview partially active -- do 'show multiviews status'

Examples:

Event::DeviceState::EE5(d8:80:39:9b:c:e5)::Jun-18-02:42:56:PM::15::: state=up, uptime=1234, cable=connected, sizeX=3840, sizeY=2160, fps=60, receivingVideoFromEncoder=no, reason=encoder hdmi down

DeviceStateChange: device up/down

Message: state=up|down

Example:

CableConnection

Message: cable=connected|disconnected

Example:

Event::CableConnection::EE5(d8:80:39:9b:c:e5)::Jun-18-02:42:56:PM::15::: cable=connected
VideoStatusChange: sending video or not and why

**Message:** receivingVideoFromEncoder=no|yes|yes-with-warning [, reason=<reason> | warning=<warning>]

**Example:**

```
receivingVideoFromEncoder=no, reason=encoder hdmi down
```

ResolutionChange: just resolution change

**Message:** sizeX=from->to, sizeY=from->to, fps=from->to

**Example:**

```
sizeX=1920->3840, sizeY=1080->2160, fps=59.95->59.94
```

VideoChanged: encoder only, non-resolution change

**Message:** interlaced=<from>-><to>, color=<from>-><to>,
    colorDepth=<from>-><to>, hdcp=<from>-><to>, hdcpVersion=<from>-><to>,
    hdmi20=<from>-><to>

**Where:**
- Interlaced: yes, no
- Color values: RGB, YUV444, YUV422, YUV420
- colorDepth: 8, 10, 12
- hdcp: yes, no
- hdcpVersion: none, 1.4, 2.2
- hdmi20: yes, no

**Example:**

```
interlaced=yes->no, color=RGB->YUV444, colorDepth=8->10, hdcp=yes->no,
hdcpVersion=1.4->2.2, hdmi20=no->yes
```

RS232Data

**Message:** data=<rs232Data>

**Example:**

```
data="hello there"
```

**Note:** RS232 events are only sent after a termination character has been received. If there are no termination characters defined, an event is generated after 10ms of no additional input.
**Event Mechanism**

**IRData**

**Message:** data=<irData>

**Example:**

```
Event::IrData::DCD(d8:80:39:9a:d0:cd)::Jun-19-05:02:07:PM::133:::
data="0000006d0000002700ae00a70016000f001500100015000f00150
0100015000f001500340016000f0015000f0015000f00150010001400100
01400100015000f00140010008001600350016003400160034001600034001
01500100015000f001500100015000f001500100014001000140010001
5000f001500340016003300160034001600340016003300160-0
034001600330016017c"
```

**AutoEdidSelect**

**Message:** sourceDecoder=<dec>, edidValid=yes|no, pixClockMhz=<from>-<to>, color=<from>-><to>, colorDepth=<from>-><to>, onlyPcmAudio=<from>-><to>

**Example:**

```
sourceDecoder=D14, edidValid=yes, pixClockMhz=150->600, color=RGB->YUV420, colorDepth=8->10, onlyPcmAudio=no->no
```

**MulticastConflict**

**Message:** conflict=<multicastAddr>, action=getting new address

**Example:**

```
conflict=224.1.1.1, action=getting new address
```

**AllocMcastFailed**

**Message:** allocation=failed

**Example:**

```
allocation=failed
```
EdidFirstChecksumInvalid

**Message:** firstChecksum=invalid

**Example:**

Event::EdidFirstChecksumInvalid::EE5(d8:80:39:9b:c:e5)::Jun-18-02:42:56:PM::15::: firstChecksum=invalid

EdidSecondChecksumInvalid

**Message:** secondChecksum=invalid

**Example:**

IRDongleButtons

**Message:** data=<irDongleButtons>

Note this event is closely related to the IrData event. If the IrData “data” matches known pattern for IrDongleButton, it will trigger the IRDongleButtons event as shown below.

**Examples:**

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:26:PM::28::: button0=open, button1=open

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:32:PM::30::: button0=open, button1=closed

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:35:PM::31::: button0=open, button1=open

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:38:PM::32::: button0=open, button1=open

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:41:PM::33::: button0=open, button1=closed

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:44:PM::34::: button0=closed, button1=closed

Event::IrDongleButtons::d33(d8:80:39:eb:39:33)::Jan-12-06:27:47:PM::35::: button0=open, button1=closed
5 SNMP and LLDP
ZyPer Management Platform SNMP and LLDP support

The ZyPer Management Platform provides SNMPv2c and SNMPv3 access to status and configuration for the server and all devices. Specifically, it provides access to:

- Server information and configuration
- General device status and configuration (common to encoders and decoders)
- Decoder-specific status and configuration
- Encoder-specific status and configuration

The SNMP MIB, ZEEVEE-MIB.txt, may be obtained from www.zeevee.com. The MIB (Management Information Base) provides variable definitions for the above data. Note that ZEEVEE-MIB.txt imports several other standard MIBs, which are also available from the ZeeVee website for convenience.

The ZMP SNMP implementation also supports the following standard MIBs for generic host management:

- SNMPv2-MIB
- IF-MIB
- IP-MIB
- TCP-MIB
- UDP-MIB

And finally, a very common companion to SNMP is LLDP – Link Layer Discover Protocol. ZMP runs an LLDP daemon that collects link neighbor information. That information may be retrieved using SNMP to create a network topology map. ZMP supports the standard MIB, LLDP-MIB.txt, to enable this.

SNMP Agent SNMPv3 Account Configuration

ZMP SNMPv3 implements a simplified User-based Security Model (USM). Client accounts use MD5 authentication without encryption and are only read-only.

Further, ZMP effectively does not implement the View-based Access Control Model (VACM), in that each account has access to the entire mib.

From the ZMP CLI, the following commands manage SNMPv3 accounts:

- add snmp user v3 accessLevel readOnly encrypted no username <newSnmpUser> password <string>
- delete snmp user v3 username <string>
- show snmp users

For example, to add user testAccount, with a password, myPassword, the following would be entered:

```
Zyper$ add snmp user v3 accessLevel readOnly auth MD5 encrypted no username testAccount password myPassword
```
Zyper$ show snmp users
snmp(172.16.2.169);
   snmp.user: version=v3, auth=MD5, encryption=none,
      username=testAccount

SNMP Agent SNMPv2c Account Configuration

SNMPv2c accounts are based only on a username, although SNMP calls it a
“community”. There is no secure authentication of the user and no encryption.

As with V3, ZMP effectively does not implement VACM – that is, each user/
community has access to the entire mib.

From the ZMP CLI, the following commands manage SNMPv2c accounts:
   add snmp user v2c accessLevel readOnly community
      <string>
   delete snmp user v2c community <snmpUser>
   show snmp users

For example:
   Zyper$ add snmp user v2c accessLevel readOnly
       community public

   Zyper$ show snmp users
snmp(172.16.2.169);
   snmp.user: version=v3, auth=MD5, encryption=none,
      username=testAccount
   snmp.user: version=v2c, community=public

SNMP Client
Choose an SNMP client. There are many. The following examples use the client
applications provided in the Linux Net-SNMP package.
Examples using Linux Net-SNMP and the above V3 account to retrieve the “zvzServerInfo” group of variables defined in the ZEEVEE-MIB.txt file:

bin $ snmpwalk -u testAccount -l authNoPriv -A myPassword 172.16.2.169 zvzServerInfo
ZEEVEE-MIB::zvzServerInfoHostname.0 = STRING: rey
ZEEVEE-MIB::zvzServerInfoVersion.0 = STRING: 2.1.35413:35414
ZEEVEE-MIB::zvzServerInfoPreviousVersion.0 = STRING: N/A
ZEEVEE-MIB::zvzServerInfoSerialNumber.0 = STRING: ZZMPFB0002b3913cf8A
ZEEVEE-MIB::zvzServerInfoUptime.0 = Timeticks: (0) 0:00:00.00
ZEEVEE-MIB::zvzServerInfoLicenseLimit.0 = INTEGER: 0
ZEEVEE-MIB::zvzServerInfoKnownDevices.0 = INTEGER: 12
ZEEVEE-MIB::zvzServerInfoDevicesUp.0 = INTEGER: 7
ZEEVEE-MIB::zvzServerInfoDevicesExceeded.0 = INTEGER: 0

And a similar example using the V2c account created above:

bin $ snmpwalk -v2c -c public 172.16.2.169 zvzServerConfig
ZEEVEE-MIB::zvzServerConfigAutoEdidMode.0 = INTEGER: enabled(1)
ZEEVEE-MIB::zvzServerConfigHdmiAudio.0 = INTEGER: allowCompressed(1)
ZEEVEE-MIB::zvzServerConfigLicense.0 = STRING: none

SNMP Notifications

There are four different types of SNMP Notifications. The original was for SNMPv1. That format is no longer in use. Then came v2C, which is very easy to use, but not used often due to lack of authentication or encryption. SNMPv3 has two different notification mechanisms. They both use the same format as defined in SNMPv2c, but add authentication and encryption. The first v3 notification is still called a trap. It is similar to v2c in that it is unreliable – the trap sender sends it over UDP and forgets. The configuration required for this form of notification is surprisingly terrible, and for that reason, not supported by ZMP. The final notification form is called an “Inform”. This is the same as the trap, but reliably sent. The receiver must acknowledge the inform, and the send must try a number of times until an acknowledgment is received. Interestingly, using the Inform is not very hard.

NOTE: Roles are reversed for notifications! ZMP is the client and your trap server… is the server. That means that to receive either v2c traps, or v3c informs, you must configure your trap daemon with the correct authentication and access control. As a warning, the net-snmp trap daemon, as with its snmp daemon, is just bit tricky to use.
From the ZMP CLI, the following commands manage notification generation:

```plaintext
add snmp trapServer v2cTrap ipAddress <address:ip> community <string>
add snmp user v2c accessLevel readOnly community <newSnmpCommunity>
add snmp user v3 accessLevel readOnly auth MD5 encrypted no username <newSnmpUser> password <string>
delete snmp trapServer v2cTrap <address:ip> community <string>
delete snmp user v2c community <snmpCommunity>
delete snmp user v3 username <snmpUser>
show snmp trapServers
show snmp users
```

More Technical Information on the Linux Net-SNMP Package

If NetSNMP is installed on Ubuntu Linux, then you either have to install the mibs in /usr/share/snmp/mibs, or use the -M command line switch to *fully* specify the path (cannot use the ~ character). For example, if the mibs are placed under your home directory, “snmp-mibs”, the following will work:

```plaintext
snmpwalk -M +${HOME}/snmp-mibs -m all -u testAccount -l authNoPriv -A myPassword 127.0.0.1 zvzServerInfo
```

Note the above example uses the account and password created in the earlier example. Further, if the mibs are copied to the /usr/share/snmp/mibs directory, then the -M in the above command may be omitted.

Note also that the Ubuntu net-snmp directory structure does not follow the man pages for net-snmp apps. Very annoying. However, any ZMP system (including in-house servers and build systems), the “standard” directories are followed. In this case, the mib directory is /usr/local/share/snmp/mibs.
There are three ways to receive events:
Updating the Software

Using Mac OS X

1. Make sure the Management Platform is powered and is working correctly.

2. Download the latest software from the ZeeVee website. Make note of the location of where the software was downloaded.

3. Launch the Terminal app, found under the Applications > Utilities folder. By default, the current directory will be the Home directory.

   Last login: Tue Mar 22 14:24:08 on console
   Andrews-MacBook-Pro:~ Andrew$

4. Change the directory to the location of the downloaded software file. For example, if the software was downloaded to the Desktop, then change to the Desktop folder, as shown:

   Last login: Tue Mar 22 14:24:08 on console
   Andrews-MacBook-Pro:~ Andrew$ cd desktop
   Andrews-MacBook-Pro:desktop Andrew$

5. Use the FTP protocol to login to the Management Platform. At the terminal prompt, type the following and press the [ENTER] key.

   Andrews-MacBook-Pro:desktop Andrew$ ftp 192.168.1.6

6. Enter the user name and password. Use anonymous for the user name and use guest for the password. The password will not be echoed to the screen.

   Andrews-MacBook-Pro:desktop Andrew$ ftp 192.168.1.6
   Connected to 192.168.1.6
   220 (vsFTPd 3.0.2)
   Name (192.168.1.6:Andrew): anonymous
   331 Please specify the password.
   Password:
   230 Login successful.
   Remote system type is UNIX.
   Using binary mode to transfer files.
   ftp>

7. Type cd files at the ftp prompt to change to the /files directory.

   ftp> cd files
   250 Directory successfully changed.
   ftp>
Enter and run the `put` command, followed by the full name of the software file, as shown. Make sure to replace `[version]` with the version of the filename you are using. For example:

```
ftp> put update_nuc_2.2.36708.zyper
```

8. **Press the [ENTER] key.** Information similar to the following will be displayed.

```
local: update_nuc_1.07.1.33348.zyper  remote: update_nuc_1.7.1.33348.zyper
229 Entering Extended Passive Mode (|||35257|).
150 Ok to send data.
100% |*******************************************| 6830 KiB  94.30 MiB/s  00:00 ETA
226 Transfer complete.
6994519 bytes sent in 00:00 (92.30 MiB/s)
```

9. **Type the `exit` command to exit FTP.**

```
ftp> exit
Andrews-MacBook-Pro:desktop Andrew$
```

10. **Telnet to the Management Platform, as shown.**

```
$ telnet 192.168.1.6
Trying 192.168.1.6...
Connected to 192.168.1.6
Escape character is `^]`.
zyper$
```

Use the `update` command to update the Management Platform. Once entered, the Management Platform will reboot and the software will be updated. Note that the connection will be lost, temporarily, during the update process.

```
zyper$ update server update_nuc_2.2.36708.zyper
Success
Server rebooting; connection will end
```
Using Windows

1. Make sure the Management Platform is powered and is working correctly.

2. Download the latest software from the ZeeVee website. Make note of the location of where the software was downloaded.

3. Open Chrome and enter the IP address of the Management Platform using the FTP protocol. For example:

   ftp://169.254.185.207

4. The /files folder will be displayed.

5. Drag-and-drop the latest software file to the /files folder.

6. Use the Telnet protocol to access the Management Platform API.

7. Use the `update` command to update the Management Platform. Once entered, the Management Platform will reboot and the software will be updated. Note that the connection will be lost, temporarily, during the update process.

   zyper$ update server update_nuc_1.7.1.33321.zyper
   Success

   Server rebooting; connection will end
Using ZyPer Management Platform

1. Make sure the Management Platform is powered and is working correctly.

2. Download the latest software from the ZeeVee website. Make note of the location of where the software was downloaded.

3. Login to the ZyPer Management Platform. Refer to Accessing ZMP (page 11) for more information.

4. Click the Server option at the left of the page.

5. Scroll down within the Server pain until you see the option to Update Server Software. Drag the latest software into the box and press Update Server to begin process. (Note: You can also revert the server to the previously installed version of software by clicking the Revert Server button) “Show advanced controls” must be enabled to use this option.
**Important Note:**

The ZyPer MP update file will be available in four, platform-specific versions. Please use the correct version for the hardware platform being updated.

- ZyPerMP NUC computer (Single Ethernet Port): update_nuc_2.5.xxxxx.zyper
- ZyPerMP NUC computer (Two Ethernet Ports): update_nuc2004_2.5.xxxxx.zyper
- ZyPerMP Proserver: update_proserver_2.5.xxxxx.zyper
- ZyPerMP VMware: update_vm_2.5.xxxxx.zyper
Redundancy Configuration Instructions

To configure redundancy, follow the steps below. The secondary server must be running for the redundancy fields to be visible in ZMP or the API.

Configuring redundancy through the API

Configuring the IP Address
1) Login to the main ZMP, or Master through telnet.
2) Issue the "set server redundancy all-servers" command to configure redundancy

IE: set server redundancy all-servers virtual-ip address 172.16.5.239 network-interface video

3) Use the "show server redundancy" command to review the redundancy configuration and confirm the changes
4) Login to the Secondary server, or Slave, through telnet.
5) Use the "show server redundancy" command to review the redundancy configuration and confirm the changes

Configure the preferred roles
1) Login to the Master ZMP through telnet.
2) Issue the "set server redundancy this-server" command to set the preferred master and slave states on the server.
IE: set server redundancy this-server preferred-master true preferred-slave false

3) Use the "show server redundancy" command to review the redundancy configuration and confirm the changes
4) Login to the Slave ZMP through telnet.
5) Use the "show server redundancy" command to review the redundancy configuration and confirm the changes

Configuring redundancy through ZMP
1) Login through you Master ZMP GUI with Chrome.
2) Open the Server Panel
3) Scroll down to the Redundancy fields
4) Set the fields listed below.
**Virtual IP**: The IP address that the Master and Slave servers will use. This IP address must be unique and available on the network as it will be used for telnet access for the API as well as ZMP.

**Virtual Mask**: The subnet mask for the virtual interface, must be correct for the IP address listed above and not it should not conflict with the main eth0 interface.

**Preferred Roles Radio Button**: The preferred roles for the server. This field is used to decide the Master or Slave upon both servers initializing at the same time. Although rare, this can occur.

**State**: The current role of the current Server connected to.

After configuration is complete on the Master, the information should populate to the Slave server. The preferred roles for the Slave server will still need to be configured. This can be done by logging into ZMP using the Slave server IP address and modifying the Preferred roles.

The “State” field will reflect the servers current state.

5) After the configuration changes are made, login into ZMP with the Virtual IP address configured above.

The server panel should show the correct redundancy information.

**Note**: The “switchover” button above will allow the servers to swap roles as needed.
Virtual interface on the ZMP.

Below is an example of the output of the “ifconfig” from the ZMP showing the virtual IP configured on the current master server.

```
eth0  Link encap:Ethernet  HWaddr 40:8d:5c:32:46:0e
       inet addr:172.16.5.240  Bcast:172.16.5.255  Mask:255.255.255.0
